

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

October 18, 2024

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

Since the version 4.0, the syntax of the absolute and relative paths used in `\PitonInputFile` has been changed: cf. part 6.1, p. 11.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape` (except when the key `write` is used). The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages `listings` and `minted`.

The name of this extension (`piton`) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 4.1 of **piton**, at the date of 2024/10/18.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by `#>`.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`³;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the languages supported natively by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language: \PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset informatic codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.
- The command `\PitonInputFile` is used to insert and typeset an external file: cf. 6.1 p. 11.

³That language `minimal` may be used to format pseudo-codes: cf. p. 31

3.4 The syntax of the command \piton

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- [Syntax `\piton{...}`](#)

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a %;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands⁴ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#" # an affectionation }
\piton{c="#" \\ \\ # an affectionation }
\piton{MyDict = {'a': 3, 'b': 4 }}

MyString = '\n'
def even(n): return n%2==0
c="#" # an affectionation
c="#" # an affectionation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁵

However, since the argument is expanded (in the TeX sens), one should take care not using in its argument *fragile* commands (that is to say commands which are neither *protected* nor *fully expandable*).

- [Syntax `\piton|...|`](#)

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#" # an affectionation +
\piton?MyDict = {'a': 3, 'b': 4}?

MyString = '\n'
def even(n): return n%2==0
c="#" # an affectionation
MyDict = {'a': 3, 'b': 4 }
```

4 Customization

4.1 The keys of the command \PitonOptions

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁶

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

⁴That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁵For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

⁶We remind that a LaTeX environment is, in particular, a TeX group.

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the six built-in languages (Python, OCaml, C, SQL, `minimal` and `verbatim`) or the name of a language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 9).

The initial value is Python.

- **New 4.0**

The key `font-command` contains instructions of font which will be inserted at the beginning of all the elements composed by `piton` (without surprise, these instructions are not used for the so-called “LaTeX comments”).

The initial value is `\ttfamily` and, thus, `piton` uses by default the current monospaced font.

- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of gobble is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁷ of the current environment in that file. At the first use of a file by `piton`, it is erased.

This key requires a compilation with `lualatex -shell-escape`.

- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁸
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁹
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.1.2, p. 11). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.

⁷In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 23).

⁸For the language Python, the empty lines in the docstrings are taken into account (by design).

⁹When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is `0.7 em`.
- The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em ,
        format = \footnotesize \color{blue}
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 23.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!15,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.2.1, p. 13).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX¹⁰.

For an example of use of `width=min`, see the section 8.2, p. 24.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹¹ are replaced by the character `U+2423` : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹²

Example : `my_string = 'Very\u2423good\u2423answer'`

¹⁰The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `texmk` (used by Overleaf) do automatically a sufficient number of compilations.

¹¹With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

¹²The initial value of `font-command` is `and`, thus, by default, `piton` merely uses the current monospaced font.

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹³ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by piton. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C, line-numbers, auto-gobble, background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 13).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the informatic listings. The customizations done by that command are limited to the current TeX group.¹⁴

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

¹³cf. 6.2.1 p. 13

¹⁴We remind that a LaTeX environment is, in particular, a TeX group.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luacolor` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!30] }
```

In that example, `\highLight[red!30]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!30]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL, “minimal” and “verbatim”), are described in the part 9, starting at the page 27.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word **function** formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁵

For example, with the command

```
\SetPitonStyle[SQL]{Keyword = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).¹⁶

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

¹⁵We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹⁶As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

4.2.3 The style UserFunction

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style `\PitonStyle{Identifier}` and, therefore, the names of the functions are formatted like the other identifiers (that is to say, by default, with no special formatting except the features provided in `font-command`). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}
\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for in in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹⁷

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁸

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{O{}{\PitonOptions{#1}}{}}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

¹⁷We remind that, in `piton`, the name of the informatic languages are case-insensitive.

¹⁸However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

```
\NewPitonEnvironment{Python}{}  
\begin{tcolorbox}  
\end{tcolorbox}
```

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}  
def square(x):  
    """Compute the square of a number"""  
    return x*x  
\end{Python}
```

```
def square(x):  
    """Compute the square of a number"""  
    return x*x
```

5 Definition of new languages with the syntax of listings

The package `listings` is a famous LaTeX package to format informatic listings. That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C, SQL, `minimal` and `verbatim`), which allows more powerful parsers.

For example, in the file `1stlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto,if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%  
sensitive,%  
morecomment=[1]//,%  
morecomment=[s]{/*}{*/},%  
morestring=[b]",%  
morestring=[b]',%  
}[keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto,if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%  
sensitive,%
```

```

morecomment=[l]//,%  

morecomment=[s]{/*}{{*}},%  

morestring=[b]",%  

morestring=[b]',%  

}

```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁹

```

public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}

```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `@` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

¹⁹We recall that, for piton, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

6 Advanced features

6.1 Insertion of a file

6.1.1 The command \PitonInputFile

The command `\PitonInputFile` includes the content of the file specified in argument (or only a part of that file: see below). The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

Modification 4.0

The syntax for the absolute and relative paths has been changed in order to be conform to the traditionnal usages. However, it's possible to use the key `old-PitonInputFile` at load-time (that is to say with the `\usepackage`) in order to have the old behaviour (though, that key will be deleted in a future version of `piton`!).

Now, the syntax is the following one:

- The paths beginning by / are absolute.

Example : \PitonInputFile{/Users/joe/Documents/program.py}

- The paths which do not begin with / are relative to the current repertory.

Example : \PitonInputFile{my_listings/program.py}

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

As previously, the absolute paths must begin with /.

6.1.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>

```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v

```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}
```

```

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>

```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

6.2 Page breaks and line breaks

6.2.1 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces which appear in the strings of the informatic languages).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return (on the condition that the used font is a monospaced font and this is the case by default since the initial value of `font-command` is `\ttfamily`).
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+ \;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\hookrightarrow \;`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+       ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
            our_dict[name] = [treat_Postscript_line(k) for k in \
+                           ↪ list_letter[1:-1]]
    return dict
```

New 4.1

With the key `break-strings-anywhere`, the strings may be broken anywhere (and not only on the spaces).

6.2.2 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, `piton` provides the keys `splittable-on-empty-lines` and `splittable` to allow such breaks.

- The key `splittable-on-empty-lines` allows breaks on the empty lines. The “empty lines” are in fact the lines which contains only spaces.
- Of course, the key `splittable-on-empty-lines` may not be sufficient and that’s why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines.²⁰

For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it’s probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²¹

6.3 Splitting of a listing in sub-listings

The extension `piton` provides the key `split-on-empty-lines`, which should not be confused with the key `splittable-on-empty-lines` previously defined.

In order to understand the behaviour of the key `split-on-empty-lines`, one should imagine that he has to compose an informatic listing which contains several definitions of informatic functions. Usually, in the informatic languages, those definitions of functions are separated by empty lines.

The key `split-on-empty-lines` splits the listings on the empty lines. Several empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it’s possible to put the TeX primitive `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.

New 4.0

Each chunk of the informatic listing is composed in an environment whose name is given by the key `env-used-by-split`. The initial value of that parameter is, not surprisingly, `Piton` and, hence, the different chunks are composed in several environments `{Piton}`. If one decides to change the value of `env-used-by-split`, he should use the name of an environment created by `\NewPitonEnvironment` (cf. part 4.3, p. 8).

Each chunk of the informatic listing is formated in its own environment. Therefore, it has its own line numbering (if the key `line-numbers` is in force) and its own colored background (when the key `background-color` is in force), separated from the background color of the other chunks. When used, the key `splittable` applies in each chunk (independently of the other chunks). Of course, a page break may occur between the chunks of code, regardless of the value of `splittable`.

²⁰Remark that we speak of the lines of the original informatic listing and such line may be composed on several lines in the final PDF when the key `break-lines-in-Piton` is in force.

²¹With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```
\begin{Piton}[split-on-empty-lines,background-color=gray!15,line-numbers]
def square(x):
    """Computes the square of x"""
    return x*x

def cube(x):
    """Calcule the cube of x"""
    return x*x*x
\end{Piton}
```

```
1 def square(x):
2     """Computes the square of x"""
3     return x*x
```

```
1 def cube(x):
2     """Calcule the cube of x"""
3     return x*x*x
```

Caution: Since each chunk is treated independently of the others, the commands specified by `detected-commands` and the commands and environments of Beamer automatically detected by `piton` must not cross the empty lines of the original listing.

6.4 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.²²
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf. 4.2 p. 6).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}
```

²²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

```

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [x for x in l[1:] if x < a ]
        l2 = [x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by piton.

```

\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)

```

6.5 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.6 p. 19.

6.5.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It’s possible to change the formatting of the LaTeX comment itself by changing the `piton style Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part [8.2 p. 24](#)

If the user has required line numbers (with the key `line-numbers`), it’s possible to refer to a number of line with the command `\label` used in a LaTeX comment.²³

6.5.2 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.5.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).

In the following example, which is a recursive programmation of the factorial function, we decide to highlight the recursive call. The command `\highLight` of `lua-ul`²⁴ directly does the job with the easy syntax `\highLight{...}`.

We assume that the preamble of the LaTeX document contains the following line:

²³That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

²⁴The package `lua-ul` requires itself the package `luacolor`.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

6.5.4 The mechanism “escape”

It's also possible to overwrite the informatic listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, piton does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, available only in the preamble of the document.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `luatex`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!,end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Caution : The mechanism “escape” is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.5.5 The mechanism “escape-math”

The mechanism “escape-math” is very similar to the mechanism “escape” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “escape-math” is in fact rather different from that of the mechanism “escape”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and, therefore, they can’t be used to change the formatting of other lexical units.

In the languages where the character \$ does not play a important role, it’s possible to activate that mechanism “escape-math” with the character \$:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character \$ must *not* be protected by a backslash.

However, it’s probably more prudent to use \(\) et \(), which are delimiters of the mathematical mode provided by LaTeX.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \(-\arctan(-x)\)
    elif \(x > 1\) :
        return \( \pi/2 - \arctan(1/x) \)
    else:
        s = \(0\)
        for \(k\) in range(\(n\)): s += \(\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\)
    return s
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

6.6 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it’s necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁵

When the package `piton` is used within the class `beamer`²⁶, the behaviour of `piton` is slightly modified, as described now.

²⁵Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁶The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it’s also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

6.6.1 {Piton} et \PitonInputFile are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

6.6.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause27` ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ; It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁸ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings `"{"` and `"}"` are correctly interpreted (without any escape character).

²⁷One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁸The short strings of Python are the strings delimited by characters `'` or the characters `"` and not `'''` nor `"""`. In Python, the short strings can't extend on several lines.

6.6.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class beamer, the following environments of Beamer are directly detected in the environments {Piton} (and in the listings processed by \PitonInputFile): {actionenv}, {alertenv}, {invisibleenv}, {onlyenv}, {uncoverenv} and {visibleenv}.

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
        return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}
```

Remark concerning the command \alert and the environment {alertenv} of Beamer

Beamer provides an easy way to change the color used by the environment {alertenv} (and by the command \alert which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment {Piton}, such tuning will probably not be the best choice because piton will, by design, change (most of the time) the color the different elements of text. One may prefer an environment {alertenv} that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command \highLight of lua-ul (that extension requires also the package luacolor).

```
\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother
```

That code redefines locally the environment {alertenv} within the environments {Piton} (we recall that the command \alert relies upon that environment {alertenv}).

6.7 Footnotes in the environments of piton

If you want to put footnotes in an environment {Piton} or (or, more unlikely, in a listing produced by \PitonInputFile), you can use a pair \footnotemark–\footnotetext.

However, it's also possible to extract the footnotes with the help of the package footnote or the package footnotehyper.

If piton is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If piton is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferentially. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it’s also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.5.3, p. 17).

In this document, the package `piton` has been loaded with the option `footnotehyper` and we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}

\PitonOptions{background-color=gray!15}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)29
    elif x > 1:
        return pi/2 - arctan(1/x)30
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can’t be broken by a page break.

```
\PitonOptions{background-color=gray!15}
\emph{\begin{minipage}{\linewidth}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}
```

²⁹First recursive call.

³⁰Second recursive call.

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )

```

^aFirst recursive call.

^bSecond recursive call.

6.8 Tabulations

Even though it's probably recommended to indent the informatics listings with spaces and not tabulations³¹, piton accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of \PitonOptions.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of piton (in lower case).

The extension piton provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of piton.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.5.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.5.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.4, p. 26.

8 Examples

8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the informatic listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by piton in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

³¹For the language Python, see the note PEP 8

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!15, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!15}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```
\PitonOptions{background-color=gray!15, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rllap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
```

```

    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s
\end{Piton}

```

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)                                recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)                         another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s

```

8.3 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. That tuning uses the command \highLight of `lua-l` (that package requires itself the package `luacolor`).

```
\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```

from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call

```

```

elif x > 1:
    return pi/2 - arctan(1/x)
    (we have used that  $\arctan(x) + \arctan(1/x) = \pi/2$  for  $x > 0$ )
else:
    s = 0
    for k in range(n):
        s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s

```

8.4 Use with pyluatex

The package `pyluatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```

\NewPitonEnvironment{PitonExecute}{!O{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}
\ignorespacesafterend}

```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 23.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.³²

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }) ; that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }) ; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is <code>\PitonStyle{Identifier}</code> and, therefore, the names of that functions are formatted like the identifiers).
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>in</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .
<code>Identifier</code>	the identifiers.

³²See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with the key language: language = OCaml.

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is \PitonStyle{Identifier} and, therefore, the names of that functions are formatted like the identifiers).
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, done, downto, do, else, exception, for, function , fun, if, lazy, match, mutable, new, of, private, raise, then, to, try , virtual, when, while and with
Keyword.Governing	the following keywords: and, begin, class, constraint, end, external, functor, include, inherit, initializer, in, let, method, module, object, open, rec, sig, struct, type and val.
Identifier	the identifiers.

9.3 The language C (and C++)

It's possible to switch to the language C with the key `language = C`.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ")
<code>String.Interpol</code>	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style <code>String.Long</code>
<code>Operator</code>	the following operators : != == << >> - ~ + / * % = < > & . @
<code>Name.Type</code>	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
<code>Name.Builtin</code>	the following predefined functions: printf, scanf, malloc, sizeof and alignof
<code>Name.Class</code>	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé <code>class</code>
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>let</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is \PitonStyle{Identifier} and, therefore, the names of that functions are formatted like the identifiers).
<code>Preproc</code>	the instructions of the preprocessor (beginning par #)
<code>Comment</code>	the comments (beginning by // or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by //> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	default, false, NULL, nullptr and true
<code>Keyword</code>	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while
<code>Identifier</code>	the identifiers.

9.4 The language SQL

It's possible to switch to the language SQL with the key `language = SQL`.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when, where and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)
<code>Identifier</code>	the identifiers.

9.6 The language “minimal”

It's possible to switch to the language “minimal” with the key `language = minimal`.

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between “ ”)
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Identifier</code>	the identifiers.

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.4, p. 15) in order to create, for example, a language for pseudo-code.

9.7 The language “verbatim”

New 4.1

It's possible to switch to the language “verbatim” with the key `language = verbatim`.

Style	Usage
<code>None...</code>	

The language `verbatim` doesn't provide any style and, thus, does not do any syntactic formating. However, it's possible to use the mechanism `detected-commands` (cf. part 6.5.3, p. 17) and the detection of the commands and environments of Beamer.

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³³

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{ " }}b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}}"
{ luatexbase.catcodetables.CatcodeTableOther, " "
{ "{\PitonStyle{Name.Function}{ " }
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}}"
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, "      " }
{ "{\PitonStyle{Keyword}{ " }
{ luatexbase.catcodetables.CatcodeTableOther, "return" }

{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - _@@_end_line:`. The token `_@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `_@@_begin_line:`. Both tokens `_@@_begin_line:` and `_@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a piton style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³³Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

```
1 (*STY)
2 \NeedsTeXFormat{LaTeX2e}
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {piton}
6   {\PitonFileVersion}
7   {\PitonFileDate}
8   {Highlight informatic listings with LPEG on LuaLaTeX}
```

The command \text provided by the package `amstext` will be used to allow the use of the command \pion{...} (with the standard syntax) in mathematical mode.

```
9 \RequirePackage { amstext }

10 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }

```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
24 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
25 {
26   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
27     { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
28     { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
29 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
30 \cs_new_protected:Npn \@@_error_or_warning:n
31   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use \c_sys_jobname_str because, with Overleaf, the value of \c_sys_jobname_str is always “output”.

```

146   piton.last_language = ''
147 }

```

10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

148 \str_new:N \l_piton_language_str
149 \str_set:Nn \l_piton_language_str { python }

```

Each time an environment of `piton` is used, the informatic code in the body of that environment will be stored in the following global string.

```
150 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
151 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
152 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

153 \bool_new:N \l_@@_in_PitonOptions_bool
154 \bool_new:N \l_@@_in_PitonInputFile_bool

```

The following parameter corresponds to the key `font-command`.

```

155 \tl_new:N \l_@@_font_command_tl
156 \tl_set:Nn \l_@@_font_command_tl { \ttfamily }

```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
157 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
158 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

159 `\int_new:N \g_@@_line_int`

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation). The technic of the auxiliary file will be used when the key `width` is used with the value `min`.

160 `\tl_new:N \g_@@_aux_tl`

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

161 `\int_new:N \l_@@_splittable_int`

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

162 `\int_set:Nn \l_@@_splittable_int { 100 }`

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

163 `\tl_new:N \l_@@_split_separation_tl`
164 `\tl_set:Nn \l_@@_split_separation_tl`
165 `{ \vspace { \baselineskip } \vspace { -1.25pt } }`

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

166 `\clist_new:N \l_@@_bg_color_clist`

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

167 `\tl_new:N \l_@@_prompt_bg_color_tl`

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

168 `\str_new:N \l_@@_begin_range_str`
169 `\str_new:N \l_@@_end_range_str`

The argument of `\PitonInputFile`.

170 `\str_new:N \l_@@_file_name_str`

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

171 `\int_new:N \g_@@_env_int`

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

172 `\str_new:N \l_@@_write_str`
173 `\seq_new:N \g_@@_write_seq`

The following boolean corresponds to the key `show-spaces`.

174 `\bool_new:N \l_@@_show_spaces_bool`

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

175 `\bool_new:N \l_@@_break_lines_in_Piton_bool`
176 `\bool_new:N \l_@@_indent_broken_lines_bool`

The following token list corresponds to the key `continuation-symbol`.

```
177 \tl_new:N \l_@@_continuation_symbol_tl  
178 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
179 \tl_new:N \l_@@_csoi_tl  
180 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \$ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
181 \tl_new:N \l_@@_end_of_broken_line_tl  
182 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
183 \bool_new:N \l_@@_break_lines_in_piton_bool
```

However, the key `break-lines_in_piton` raises that boolean but also executes the following instruction:

```
\tl_set_eq:NN \l_@@_space_in_string_tl \space
```

The initial value of `\l_@@_space_in_string_tl` is `\nobreakspace`.

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```
184 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
185 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```
186 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```
187 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
188 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
189 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
190 \dim_new:N \l_@@_numbers_sep_dim  
191 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```

192 \seq_new:N \g_@@_languages_seq

193 \int_new:N \l_@@_tab_size_int
194 \int_set:Nn \l_@@_tab_size_int { 4 }

195 \cs_new_protected:Npn \@@_tab:
{
  \bool_if:NTF \l_@@_show_spaces_bool
  {
    \hbox_set:Nn \l_tmpa_box
    { \prg_replicate:nn \l_@@_tab_size_int { ~ } }
    \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
    \(\ \mathcolor{gray}
      { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)
  }
  { \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } } }
  \int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int
}

```

The following integer corresponds to the key `gobble`.

```
208 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
209 \tl_set_eq:NN \l_@@_space_in_string_tl \nobreakspace
```

When the key `break-lines-in-piton` is set, that parameter will be replaced by `\space` (in `\piton` with the standard syntax) and when the key `show-spaces-in-strings` is set, it will be replaced by `\square` (U+2423).

At each line, the following counter will count the spaces at the beginning.

```
210 \int_new:N \g_@@_indentation_int
```

Be careful: when executed, the following command does *not* create a space (only an incrementation of the counter).

```

211 \cs_new_protected:Npn \@@_leading_space:
212   { \int_gincr:N \g_@@_indentation_int }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

213 \cs_new_protected:Npn \@@_label:n #
214 {
  \bool_if:NTF \l_@@_line_numbers_bool
  {
    \@bsphack
    \protected@write \auxout { }
    {
      \string \newlabel { #1 }
    }
  }
}

```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

222   { \int_eval:n { \g_@@_visual_line_int + 1 } }
223   { \thepage }
224 }
225 }
226 \@esphack
227 }
228 { \@@_error:n { label-with-lines-numbers } }
229 }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
230 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
231 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:... \@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
232 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
233 \cs_new_protected:Npn \@@_prompt:
234 {
235     \tl_gset:Nn \g_@@_begin_line_hook_tl
236     {
237         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
238         { \clist_set:No \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
239     }
240 }
```

The spaces at the end of a line of code are deleted by `piton`. However, it’s not actually true: they are replace by `\@@_trailing_space:`.

```
241 \cs_new_protected:Npn \@@_trailing_space: { }
```

When we have to rescan some pieces of code, we will use `\@@_piton:n`, which we will set `\@@_trailing_space:` equal to `\space`.

10.2.3 Treatment of a line of code

```
242 \cs_generate_variant:Nn \@@_replace_spaces:n { o }
243 \cs_new_protected:Npn \@@_replace_spaces:n #1
244 {
245     \tl_set:Nn \l_tmpa_tl { #1 }
246     \bool_if:NTF \l_@@_show_spaces_bool
247     {
248         \tl_set:Nn \l_@@_space_in_string_tl { \u2423 } % U+2423
249         \regex_replace_all:nnN { \x20 } { \u2423 } \l_tmpa_tl
250     }
251 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:.` Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
252     \bool_if:NT \l_@@_break_lines_in_Piton_bool
253     {
254         \regex_replace_all:nnN
255         { \x20 }
256         { \c{@@_breakable_space:} }
257         \l_tmpa_tl
258         \regex_replace_all:nnN
259         { \c{l_@@_space_in_string_tl} }
260         { \c{@@_breakable_space:} }
261         \l_tmpa_tl
262     }
263 }
```

```
265 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`.

`\@@_begin_line:` is a TeX command with a delimited argument (`\@@_end_line:` is the marker for the end of the argument).

However, we define also `\@@_end_line:` as no-op, because, when the last line of the listing is the end of an environment of Beamer (eg `\end{uncoverenv}`), we will have a token `\@@_end_line:` added at the end without any corresponding `\@@_begin_line:`).

```
266 \cs_set_protected:Npn \@@_end_line: { }
```

```
267 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
268 {
269     \group_begin:
270     \g_@@_begin_line_hook_tl
271     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```
272 \bool_if:NTF \l_@@_width_min_bool
273     \@@_put_in_coffin_i:n
274     \@@_put_in_coffin_i:n
275     {
276         \language = -1
277         \raggedright
278         \strut
279         \@@_replace_spaces:n { #1 }
280         \strut \hfil
281     }
```

Now, we add the potential number of line, the potential left margin and the potential background.

```
282 \hbox_set:Nn \l_tmpa_box
283 {
284     \skip_horizontal:N \l_@@_left_margin_dim
285     \bool_if:NT \l_@@_line_numbers_bool
286     {
```

`\l_tmpa_int` will be true equal to 1 when the current line is not empty.

```
287     \int_set:Nn \l_tmpa_int
288     {
289         \lua_now:e
290         {
291             tex.sprint
292             (
293                 luatexbase.catcodetablesexpl ,
```

Since the argument of `tostring` will be a integer of Lua (`integer` is a sub-type of `number` introduced in Lua 5.3), the output will be of the form "3" (and not "3.0") which is what we want for `\int_set:Nn`.

```
294         tostring
295             ( piton.empty_lines
296                 [ \int_eval:n { \g_@@_line_int + 1 } ]
297             )
298         )
299     }
300 }
```

`\bool_lazy_or:nnT`

```
301 { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
302 { ! \l_@@_skip_empty_lines_bool }
303 { \int_gincr:N \g_@@_visual_line_int }
304 
```

`\bool_lazy_or:nnT`

```
305 { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
306 { ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool }
307 
```

`\@@_print_number:`

```
309 }
```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```
310     \clist_if_empty:NF \l_@@_bg_color_clist
 311     {
... but if only if the key left-margin is not used !
 312         \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
 313             { \skip_horizontal:n { 0.5 em } }
 314         }
 315         \coffin_typeset:Nnnnn \l_tmpa_coffin T l \c_zero_dim \c_zero_dim
 316     }
 317     \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
 318     \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
```

We have to explicitly begin a paragraph because we will insert a TeX box (and we don't want that box to be inserted in the vertical list).

```
319     \mode_leave_vertical:
320     \clist_if_empty:NTF \l_@@_bg_color_clist
321     { \box_use_drop:N \l_tmpa_box }
322     {
323         \vtop
324         {
325             \hbox:n
326             {
327                 \@@_color:N \l_@@_bg_color_clist
328                 \vrule height \box_ht:N \l_tmpa_box
329                     depth \box_dp:N \l_tmpa_box
330                     width \l_@@_width_dim
331             }
332             \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
333             \box_use_drop:N \l_tmpa_box
334         }
335     }
336     \group_end:
337     \tl_gclear:N \g_@@_begin_line_hook_tl
338 }
```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `break-lines-in-Piton` (or `break-lines`) is used.

That command takes in its argument by currying.

```
339 \cs_set_protected:Npn \@@_put_in_coffin_i:n
340     { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```
341 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
342     {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
343     \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```
344     \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
345         { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
346     \hcoffin_set:Nn \l_tmpa_coffin
347     {
348         \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 24).

```
349     { \hbox_unpack:N \l_tmpa_box \hfil }
```

```

350      }
351  }
```

The command `\@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g @_line_int` (modulo the number of colors in the list).

```

352 \cs_set_protected:Npn \@_color:N #1
353 {
354   \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
355   \int_set:Nn \l_tmpb_int { \int_mod:nn \g @_line_int \l_tmpa_int + 1 }
356   \tl_set:Ne \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
357   \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l @_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

358   { \dim_zero:N \l @_width_dim }
359   { @_color_i:o \l_tmpa_tl }
360 }
```

The following command `\@_color:n` will accept both the instruction `\@_color:n { red!15 }` and the instruction `\@_color:n { [rgb]{0.9,0.9,0} }`.

```

361 \cs_generate_variant:Nn @_color_i:n { o }
362 \cs_set_protected:Npn @_color_i:n #1
363 {
364   \tl_if_head_eq_meaning:nNTF { #1 } [
365     {
366       \tl_set:Nn \l_tmpa_tl { #1 }
367       \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
368       \exp_last_unbraced:No \color \l_tmpa_tl
369     }
370   { \color { #1 } }
371 }
```

The command `\@_newline:` will be inserted by Lua between two lines of the informatic listing.

- In fact, it will be inserted between two commands `\@_begin_line:...@\@_end_of_line:..`
- When the key `break-lines-in-Piton` is in force, a line of the informatic code (the *input*) may result in several lines in the PDF (the *output*).
- Remind that `\@_newline:` has a rather complex behaviour because it will finish and start paragraphs.

```

372 \cs_new_protected:Npn @_newline:
373 {
374   \bool_if:NT \g @_footnote_bool \endsavenotes
```

We recall that `\g @_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```
375   \int_gincr:N \g @_line_int
```

... it will be used to allow or disallow page breaks.

Each line in the listing is composed in a box of TeX (which may contain several lines when the key `break-lines-in-Piton` is in force) put in a paragraph.

```
376   \par
```

We now add a `\kern` because each line of code is overlapping vertically by a quantity of 2.5 pt in order to have a good background (when `background-color` is in force). We need to use a `\kern` (in fact `\par\kern...`) and not a `\vskip` because page breaks should *not* be allowed on that kern.

```
377   \kern -2.5 pt
```

Now, we control page breaks after the paragraph. We use the Lua table `piton.lines_status` which has been written by `piton.ComputeLinesStatus` for this aim. Each line has a “status” (equal to 0, 1 or 2) and that status directly says whether a break is allowed.

```

378   \int_case:nn
379   {
```

```

380     \lua_now:e
381     {
382         tex.sprint
383         (
384             luatexbase.catcodetables.expl ,
385             tostring ( piton.lines_status [ \int_use:N \g_@@_line_int ] )
386         )
387     }
388   }
389   { 1 { \penalty 100 } 2 \nobreak }
390   \bool_if:NT \g_@@_footnote_bool \savenotes
391 }
```

After the command `\@@_newline:`, we will usually have a command `\@@_begin_line:..`

```

392 \cs_set_protected:Npn \@@_breakable_space:
393 {
394     \discretionary
395     { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }
396     {
397         \hbox_overlap_left:n
398         {
399             {
400                 \normalfont \footnotesize \color { gray }
401                 \l_@@_continuation_symbol_tl
402             }
403             \skip_horizontal:n { 0.3 em }
404             \clist_if_empty:NF \l_@@_bg_color_clist
405             { \skip_horizontal:n { 0.5 em } }
406         }
407     \bool_if:NT \l_@@_indent_broken_lines_bool
408     {
409         \hbox:n
410         {
411             \prg_replicate:nn { \g_@@_indentation_int } { ~ }
412             { \color { gray } \l_@@_csoi_tl }
413         }
414     }
415 }
416 { \hbox { ~ } }
```

10.2.4 PitonOptions

676   { #1 }
677   { \@@_error:n { Invalid~key } }
678 }

679 \NewDocumentCommand \PitonOptions { m }
680 {
681   \bool_set_true:N \l_@@_in_PitonOptions_bool
682   \keys_set:nn { PitonOptions } { #1 }
683   \bool_set_false:N \l_@@_in_PitonOptions_bool
684 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

685 \NewDocumentCommand \@@_fake_PitonOptions { }
686 { \keys_set:nn { PitonOptions } }

```

10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

687 \int_new:N \g_@@_visual_line_int
688 \cs_new_protected:Npn \@@_incr_visual_line:
689 {
690   \bool_if:NF \l_@@_skip_empty_lines_bool
691   { \int_gincr:N \g_@@_visual_line_int }
692 }

693 \cs_new_protected:Npn \@@_print_number:
694 {
695   \hbox_overlap_left:n
696   {
697     \l_@@_line_numbers_format_tl
698   }

```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

699   { \int_to_arabic:n \g_@@_visual_line_int }
700 }
701 \skip_horizontal:N \l_@@_numbers_sep_dim
702 }
703 }

```

10.2.6 The command to write on the aux file

```

704 \cs_new_protected:Npn \@@_write_aux:
705 {
706   \tl_if_empty:NF \g_@@_aux_tl
707   {
708     \iow_now:Nn \c_mainaux { \ExplSyntaxOn }
709     \iow_now:Ne \c_mainaux
710     {
711       \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
712       { \exp_not:o \g_@@_aux_tl }
713     }
714     \iow_now:Nn \c_mainaux { \ExplSyntaxOff }

```

```

715     }
716     \tl_gclear:N \g_@@_aux_tl
717 }
```

The following macro will be used only when the key `width` is used with the special value `min`.

```

718 \cs_new_protected:Npn \@@_width_to_aux:
719 {
720     \tl_gput_right:Ne \g_@@_aux_tl
721     {
722         \dim_set:Nn \l_@@_line_width_dim
723         { \dim_eval:n { \g_@@_tmp_width_dim } }
724     }
725 }
```

10.2.7 The main commands and environments for the final user

```

726 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
727 {
728     \tl_if_no_value:nTF { #3 }
```

The last argument is provided by currying.

```
729     { \@@_NewPitonLanguage:nnn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```
730     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
731 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```
732 \prop_new:N \g_@@_languages_prop
```

```

733 \keys_define:nn { NewPitonLanguage }
734 {
735     morekeywords .code:n = ,
736     otherkeywords .code:n = ,
737     sensitive .code:n = ,
738     keywordsprefix .code:n = ,
739     moretexcs .code:n = ,
740     morestring .code:n = ,
741     morecomment .code:n = ,
742     moredelim .code:n = ,
743     moredirectives .code:n = ,
744     tag .code:n = ,
745     alsodigit .code:n = ,
746     alsoletter .code:n = ,
747     alsoother .code:n = ,
748     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
749 }
```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```
750 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
751 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```

752     \tl_set:Ne \l_tmpa_tl
753     {
754         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
755         \str_lowercase:n { #2 }
```

```
756     }
```

The following set of keys is only used to raise an error when a key is unknown!

```
757     \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```
758     \prop_gput:Non \g_@@_languages_prop \l_tmpa_t1 { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```
759     \@@_NewPitonLanguage:on \l_tmpa_t1 { #3 }
760 }
761 \cs_generate_variant:Nn \@@_NewPitonLanguage:nn { o }
762 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
763 {
764     \hook_gput_code:nnn { begindocument } { . }
765     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
766 }
```

Now the case when the language is defined upon a base language.

```
767 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
768 {
```

We store in `\l_tmpa_t1` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{}{...}`

```
769     \tl_set:Ne \l_tmpa_t1
770     {
771         \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
772         \str_lowercase:n { #4 }
773     }
```

We retrieve in `\l_tmpb_t1` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```
774     \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_t1 \l_tmpb_t1
```

We can now define the new language by using the previous function.

```
775     { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_t1 }
776     { \@@_error:n { Language-not-defined } }
777 }
```

```
778 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }
779 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```
780     { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
```

```
781 \NewDocumentCommand { \piton } { }
782     { \peek_meaning:NTF \bgroup \@@_piton_standard \@@_piton_verbatim }
783 \NewDocumentCommand { \@@_piton_standard } { m }
784     {
785         \group_begin:
786         \bool_if:NT \l_@@_break_lines_in_piton_bool
787             { \tl_set_eq:NN \l_@@_space_in_string_t1 \space }
```

The following tuning of LaTeX in order to avoid all breaks of lines on the hyphens.

```
788     \automatichyphenmode = 1
```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Ne` below) and that's why we can provide the following escapes to the final user:

```
789     \cs_set_eq:NN \\ \c_backslash_str
790     \cs_set_eq:NN \% \c_percent_str
```

```

791 \cs_set_eq:NN \{ \c_left_brace_str
792 \cs_set_eq:NN \} \c_right_brace_str
793 \cs_set_eq:NN \$ \c_dollar_str

```

The standard command `\u` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

794 \cs_set_eq:cN { ~ } \space
795 \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
796 \tl_set:Ne \l_tmpa_tl
797 {
798     \lua_now:e
799         { piton.ParseBis('l_piton_language_str',token.scan_string()) }
800         { #1 }
801     }
802 \bool_if:NTF \l_@@_show_spaces_bool
803     { \regex_replace_all:nnN { \x20 } { \u } \l_tmpa_tl } % U+2423

```

The following code replaces the characters U+0020 (spaces) by characters U+0020 of catcode 10: thus, they become breakable by an end of line. Maybe, this programmation is not very efficient but the key `break-lines-in-piton` will be rarely used.

```

804 {
805     \bool_if:NT \l_@@_break_lines_in_piton_bool
806         { \regex_replace_all:nnN { \x20 } { \x20 } \l_tmpa_tl }
807 }

```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```

808 \if_mode_math:
809     \text { \l_@@_font_command_tl \l_tmpa_tl }
810 \else:
811     \l_@@_font_command_tl \l_tmpa_tl
812 \fi:
813 \group_end:
814 }

815 \NewDocumentCommand { \@@_piton_verbatim } { v }
816 {
817     \group_begin:
818     \l_@@_font_command_tl
819     \automatichyphenmode = 1
820     \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
821     \tl_set:Ne \l_tmpa_tl
822     {
823         \lua_now:e
824             { piton.Parse('l_piton_language_str',token.scan_string()) }
825             { #1 }
826         }
827     \bool_if:NT \l_@@_show_spaces_bool
828         { \regex_replace_all:nnN { \x20 } { \u } \l_tmpa_tl } % U+2423
829     \l_tmpa_tl
830     \group_end:
831 }

```

The following command does *not* correspond to a user command. It will be used when we will have to “rescan” some chunks of informatic code. For example, it will be the initial value of the Piton style `InitialValues` (the default values of the arguments of a Python function).

```

832 \cs_new_protected:Npn \@@_piton:n #1
833     { \tl_if_blank:nF { #1 } { \@@_piton_i:n { #1 } } }

834 \cs_new_protected:Npn \@@_piton_i:n #1
835     {

877             {
878                 \lua_now:n
879                 { piton.#1(token.scan_argument()) }
880                 { #2 }
881                 \int_to_arabic:n
882                 { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
883             }
884             {
885                 \int_to_arabic:n
886                 { \g_@@_visual_line_int + \l_@@_nb_lines_int }
887             }
888         }
889         \dim_set:Nn \l_@@_left_margin_dim
890         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
891     }
```

```
892 }
```

Whereas `\l_@@_with_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```
893 \cs_new_protected:Npn \@@_compute_width:
894 {
895     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
896     {
897         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
898         \clist_if_empty:NTF \l_@@_bg_color_clist
```

If there is no background, we only subtract the left margin.

```
899     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```
900     {
901         \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }
```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³⁴ and we use that value. Elsewhere, we use a value of 0.5 em.

```
902     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
903     { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
904     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
905     }
906 }
```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the `aux` file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```
907 {
908     \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
909     \clist_if_empty:NTF \l_@@_bg_color_clist
910     { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
911     {
912         \dim_add:Nn \l_@@_width_dim { 0.5 em }
913         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
914         { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
915         { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
916     }
917 }
918 }
```

```
919 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
920 {
```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 ("other"). The latter explains why the definition of that function is a bit complicated.

```
921 \use:x
922 {
923     \cs_set_protected:Npn
924         \use:c { _@@_collect_ #1 :w }
925         ####1
926         \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
927     }
928     {
929         \group_end:
930         \mode_if_vertical:TF { \noindent \mode_leave_vertical: } \newline
```

³⁴If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

The following line is only to compute `\l_@@_lines_int` which will be used only when both `left-margin=auto` and `skip-empty-lines = false` are in force. You should change that.

```
931           \lua_now:e { piton.CountLines ( '\lua_escape:n{##1}' ) }
```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```
932           \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
933           \@@_compute_width:
934           \l_@@_font_command_t1
935           \dim_zero:N \parskip
936           \noindent
```

Now, the key `write`.

```
937           \str_if_empty:NTF \l_@@_path_write_str
938               { \lua_now:e { piton.write = "\l_@@_write_str" } }
939               {
940                   \lua_now:e
941                       { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
942               }
943           \str_if_empty:NTF \l_@@_write_str
944               { \lua_now:n { piton.write = '' } }
945               {
946                   \seq_if_in:NoTF \g_@@_write_seq \l_@@_write_str
947                       { \lua_now:n { piton.write_mode = "a" } }
948                       {
949                           \lua_now:n { piton.write_mode = "w" }
950                           \seq_gput_left:No \g_@@_write_seq \l_@@_write_str
951                       }
952               }
```

Now, the main job.

```
953           \bool_if:NTF \l_@@_split_on_empty_lines_bool
954               \@@_retrieve_gobble_split_parse:n
955               \@@_retrieve_gobble_parse:n
956               { ##1 }
```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
957           \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```
958           \end { #1 }
959           \@@_write_aux:
960       }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```
961           \NewDocumentEnvironment { #1 } { #2 }
962           {
963               \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
964               #3
965               \@@_pre_env:
966               \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
967                   { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
968               \group_begin:
969               \tl_map_function:nN
970                   { \ \\ \{ \} \$ \& \# \^ \_ \% \~ \^\I }
971                   \char_set_catcode_other:N
972                   \use:c { _@@_collect_ #1 :w }
973               }
974           { #4 }
```

The following code is for technical reasons. We want to change the catcode of `^M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an

instance of the environment, a spurious space is inserted, probably because the `^^M` is converted to space).

```
975   \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^^M }
976 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will retrieve the first empty line, gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```
977 \cs_new_protected:Npn \@@_retrieve_gobble_parse:n
978 {
979   \lua_now:e
980   {
981     piton.RetrieveGobbleParse
982     (
983       '\l_piton_language_str' ,
984       \int_use:N \l_@@_gobble_int ,
985       \bool_if:NTF \l_@@_splittable_on_empty_lines_bool
986         { \int_eval:n { - \l_@@_splittable_int } }
987         { \int_use:N \l_@@_splittable_int } ,
988       token.scan_argument ( )
989     )
990   }
991 }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```
992 \cs_new_protected:Npn \@@_retrieve_gobble_split_parse:n
993 {
994   \lua_now:e
995   {
996     piton.RetrieveGobbleSplitParse
997     (
998       '\l_piton_language_str' ,
999       \int_use:N \l_@@_gobble_int ,
1000       \int_use:N \l_@@_splittable_int ,
1001       token.scan_argument ( )
1002     )
1003   }
1004 }
```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```
1005 \bool_if:NTF \g_@@_beamer_bool
1006 {
1007   \NewPitonEnvironment { Piton } { d < > 0 { } }
1008   {
1009     \keys_set:nn { PitonOptions } { #2 }
1010     \tl_if_novalue:nTF { #1 }
1011       { \begin { uncoverenv } }
1012       { \begin { uncoverenv } < #1 > }
1013   }
1014   { \end { uncoverenv } }
1015 }
1016 {
1017   \NewPitonEnvironment { Piton } { 0 { } }
1018   { \keys_set:nn { PitonOptions } { #1 } }
1019   { }
1020 }
```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```
1021 \NewDocumentCommand { \PitonInputFileTF } { d < > O { } m m m }
1022 {
1023     \group_begin:
```

In version 4.0 of piton, we changed the mechanism used by piton to search the file to load with `\PitonInputFile`. With the key `old-PitonInputFile`, it's possible to keep the old behaviour but it's only for backward compatibility and it will be deleted in a future version.

```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`.

```

1114 \lua_now:e { piton.CountLinesFile ( '\l_@@_file_name_str' ) }

```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

1115 \@@_compute_left_margin:no { CountNonEmptyLinesFile } \l_@@_file_name_str
1116 \@@_compute_width:
1117 \l_@@_font_command_tl
1118 \lua_now:e
1119   {
1120     piton.ParseFile(
1121       '\l_piton_language_str' ,
1122       '\l_@@_file_name_str' ,
1123       \int_use:N \l_@@_first_line_int ,
1124       \int_use:N \l_@@_last_line_int ,
1125       \bool_if:NTF \l_@@_splittable_on_empty_lines_bool
1126         { \int_eval:n { - \l_@@_splittable_int } }
1127         { \int_use:N \l_@@_splittable_int } ,
1128       \bool_if:NTF \l_@@_split_on_empty_lines_bool { 1 } { 0 } )

```

```

1129     }
1130     \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
1131     \group_end:

```

The following line is to allow programs such as `latexmk` to be aware that the file (read by `\PitonInputFile`) is loaded during the compilation of the LaTeX document.

```

1132     \iow_log:e {(\l_@@_file_name_str)}

```

We recall that, if we are in Beamer, the command `\PitonInputFile` is “overlay-aware” and that’s why we close now an environment `{uncoverenv}` that we have opened at the beginning of the command.

```

1133     \tl_if_no_value:nF { #1 }
1134     { \bool_if:NT \g_@@_beamer_bool { \end { uncoverenv } } }
1135     \@@_write_aux:
1136 }

```

The following command computes the values of `\l_@@_first_line_int` and `\l_@@_last_line_int` when `\PitonInputFile` is used with textual markers.

```

1137 \cs_new_protected:Npn \@@_compute_range:
1138 {

```

We store the markers in L3 strings (`str`) in order to do safely the following replacement of `\#`.

```

1139   \str_set:Ne \l_tmpa_str { \@@_marker_beginning:n \l_@@_begin_range_str }
1140   \str_set:Ne \l_tmpb_str { \@@_marker_end:n \l_@@_end_range_str }

```

We replace the sequences `\#` which may be present in the prefixes (and, more unlikely, suffixes) added to the markers by the functions `\@@_marker_beginning:n` and `\@@_marker_end:n`

```

1141   \regex_replace_all:nnN { \\# } \c_hash_str \l_tmpa_str
1142   \regex_replace_all:nnN { \\# } \c_hash_str \l_tmpb_str
1143   \lua_now:e

1285 Preproc             = \color[HTML]{AA6600} \slshape ,

```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```

1286 Identifier.Internal = \@@_identifier:n ,
1287 Identifier          = ,
1288 Directive           = \color[HTML]{AA6600} ,
1289 Tag                 = \colorbox{gray!10},
1290 UserFunction        = \PitonStyle{Identifier} ,
1291 Prompt              = ,
1292 Discard             = \use_none:n
1293 }

```

If the key `math-comments` has been used in the preamble of the LaTeX document, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```

1294 \hook_gput_code:nnn { begindocument } { . }
1295 {
1296   \bool_if:NT \g_@@_math_comments_bool
1297     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1298 }

```

10.2.10 Highlighting some identifiers

```

1299 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1300 {
1301   \clist_set:Nn \l_tmpa_clist { #2 }
1302   \tl_if_no_value:nTF { #1 }
1303   {
1304     \clist_map_inline:Nn \l_tmpa_clist
1305       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1306   }
1307   {
1308     \str_set:Ne \l_tmpa_str { \str_lowercase:n { #1 } }
1309     \str_if_eq:onT \l_tmpa_str { current-language }
1310       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1311     \clist_map_inline:Nn \l_tmpa_clist
1312       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1313   }
1314 }
1315 \cs_new_protected:Npn \@@_identifier:n #
1316 {
1317   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1318   {
1319     \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1320       { \PitonStyle { Identifier } }
1321   }
1322 { #1 }
1323 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style

`Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1324 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1325 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1326 { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`).

```
1327 \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1328 { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1329 \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1330 { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1331 \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```
1332 \seq_if_in:Nf \g_@@_languages_seq \l_piton_language_str
1333 { \seq_gput_left:No \g_@@_languages_seq \l_piton_language_str }
1334 }
```

```
1335 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1336 {
1337 \tl_if_no_value:nTF { #1 }
```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```
1338 { \@@_clear_all_functions: }
1339 { \@@_clear_list_functions:n { #1 } }
1340 }
```

```
1341 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1342 {
1343 \clist_set:Nn \l_tmpa_clist { #1 }

1585 \end{STY}

```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```
1586 (*LUA)
1587 piton.comment_latex = piton.comment_latex or ">"
1588 piton.comment_latex = "#" .. piton.comment_latex
1589 local sprintL3
1590 function sprintL3 ( s )
1591   tex.sprint ( luatexbase.catcodetables.expl , s )
1592 end
```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```
1593 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1594 local Cs, Cg, Cmt, Cb = lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1595 local B, R = lpeg.B, lpeg.R
```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the informatic listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
1596 local Q
1597 function Q ( pattern )
1598   return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1599 end
```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```
1600 local L
1601 function L ( pattern ) return
1602   Ct ( C ( pattern ) )
1603 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1604 local Lc
1605 function Lc ( string ) return
1606   Cc ( { luatexbase.catcodetables.expl , string } )
1607 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1608 e
1609 local K
1610 function K ( style , pattern ) return
```

```

1611   Lc ( [[ {\PitonStyle{ }}] .. style .. "}{" )
1612   * Q ( pattern )
1613   * Lc "}" )
1614 end

```

The formatting commands in a given piton style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```

1615 local WithStyle
1616 function WithStyle ( style , pattern ) return
1617   Ct ( Cc "Open" * Cc ( [[{\PitonStyle{}}]] .. style .. "}{" ) * Cc "}" )
1618   * pattern
1619   * Ct ( Cc "Close" )
1620 end

```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```

1621 Escape = P ( false )
1622 EscapeClean = P ( false )
1623 if piton.begin_escape then
1624   Escape =
1625     P ( piton.begin_escape )
1626     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1627     * P ( piton.end_escape )

```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1628 EscapeClean =
1629   P ( piton.begin_escape )
1630   * ( 1 - P ( piton.end_escape ) ) ^ 1
1631   * P ( piton.end_escape )
1632 end
1633 EscapeMath = P ( false )
1634 if piton.begin_escape_math then
1635   EscapeMath =
1636     P ( piton.begin_escape_math )
1637     * Lc "\ensuremath{"
1638     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1639     * Lc "}"
1640     * P ( piton.end_escape_math )
1641 end

```

The following line is mandatory.

```
1642 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```

1643 local alpha , digit = lpeg.alpha , lpeg.digit
1644 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```

1645 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1646           + "ô" + "û" + "ü" + "Ã" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
1647           + "í" + "Í" + "ô" + "Û" + "Ü"
1648
1649 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1650 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1651 local Identifier = K ( 'Identifier.Internal' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```
1652 local Number =
1653   K ( 'Number' ,
1654     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1655       + digit ^ 0 * P "." * digit ^ 1
1656       + digit ^ 1 )
1657     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1658     + digit ^ 1
1659   )
```

We will now define the LPEG `Word`.

We have a problem in the following LPEG because, obviously, we should adjust the list of symbols with the delimiters of the current language (no?).

```
1660 local lpeg_central = 1 - S " \"\r[({})]" - digit
```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```
1661 if piton.begin_escape then
1662   lpeg_central = lpeg_central - piton.begin_escape
1663 end
1664 if piton.begin_escape_math then
1665   lpeg_central = lpeg_central - piton.begin_escape_math
1666 end
1667 local Word = Q ( lpeg_central ^ 1 )

1668 local Space = Q " " ^ 1
1669
1670 local SkipSpace = Q " " ^ 0
1671
1672 local Punct = Q ( S ",,:;!" )
1673
1674 local Tab = "\t" * Lc [[ \@@_tab: ]]
```

Remember that `\@@_leading_space:` does *not* create a space, only an incrementation of the counter `\g_@@_indentation_int`.

```
1675 local SpaceIndentation = Lc [[ \@@_leading_space: ]] * Q " "
```

```
1676 local Delim = Q ( S "[({})]" )
```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_in_string_t1`. It will be used in the strings. Usually, `\l_@@_space_in_string_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_in_string_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1677 local SpaceInString = space * Lc [[ \l_@@_space_in_string_t1 ]]
```

Several tools for the construction of the main LPEG

```

1678 local LPEG0 = { }
1679 local LPEG1 = { }
1680 local LPEG2 = { }
1681 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern *which does no catching*.

```

1682 local Compute_braces
1683 function Compute_braces ( lpeg_string ) return
1684     P { "E" ,
1685         E =
1686         (
1687             "{ " * V "E" * "}" *
1688             +
1689             lpeg_string
1690             +
1691             ( 1 - S "{}" )
1692         ) ^ 0
1693     }
1694 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures.

```

1695 local Compute_DetectedCommands
1696 function Compute_DetectedCommands ( lang , braces ) return
1697     Ct (
1698         Cc "Open"
1699         * C ( piton.DetectedCommands * space ^ 0 * P "{" )
1700         * Cc "}"
1701     )
1702     * ( braces
1703         / ( function ( s )
1704             if s ~= '' then return
1705                 LPEG1[lang] : match ( s )
1706             end
1707         end )
1708     )
1709     * P "}"
1710     * Ct ( Cc "Close" )
1711 end

1712 local Compute_LPEG_cleaner
1713 function Compute_LPEG_cleaner ( lang , braces ) return
1714     Ct ( ( piton.DetectedCommands * {"}
1715         * ( braces
1716             / ( function ( s )
1717                 if s ~= '' then return
1718                     LPEG_cleaner[lang] : match ( s )
1719                 end
1720             end )
1721         )
1722         * "}"
1723         + EscapeClean
1724         + C ( P ( 1 ) )
1725     ) ^ 0 ) / table.concat
1726 end

```

The following function `ParseAgain` will be used in the definitions of the LPEG of the different informatic languages when we will need to *parse again* a small chunk of code. It's a way to avoid the use of a actual *grammar* of LPEG (in a sens, a recursive regular expression).

Remark that there is no piton style associated to a chunk of code which is analyzed by `ParseAgain`. If we wish a piton style available to the final user (if he wish to format that element with a uniform font instead of an analyze by `ParseAgain`), we have to use `\@@_piton:n`.

```

1727 local ParseAgain
1728 function ParseAgain ( code )
1729   if code ~= '' then return

```

The variable `piton.language` is set in the function `piton.Parse`.

```

1730   LPEG1[piton.language] : match ( code )
1731 end
1732 end

```

Constructions for Beamer If the class `Beamer` is used, some environments and commands of `Beamer` are automatically detected in the listings of piton.

```

1733 local Beamer = P ( false )
1734 local BeamerBeginEnvironments = P ( true )
1735 local BeamerEndEnvironments = P ( true )
1736 piton.BeamerEnvironments = P ( false )
1737 for _, x in ipairs ( piton.beamer_environments ) do
1738   piton.BeamerEnvironments = piton.BeamerEnvironments + x
1739 end

1740 BeamerBeginEnvironments =
1741   ( space ^ 0 *
1742     L
1743     (
1744       P [[\begin{}]] * piton.BeamerEnvironments * "}"
1745       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1746     )
1747     * "\r"
1748   ) ^ 0

1749 BeamerEndEnvironments =
1750   ( space ^ 0 *
1751     L ( P [[\end{}]] * piton.BeamerEnvironments * "}" )
1752     * "\r"
1753   ) ^ 0

```

The following Lua function will be used to compute the LPEG `Beamer` for each informatic language.

```

1754 local Compute_Beamer
1755 function Compute_Beamer ( lang , braces )

```

We will compute in `lpeg` the LPEG that we will return.

```

1756   local lpeg = L ( P [[\pause]] * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1757   lpeg = lpeg +
1758     Ct ( Cc "Open"
1759       * C ( piton.BeamerCommands
1760         * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1761         * P "{"
1762           )
1763         * Cc "}"
1764       )
1765       * ( braces /
1766         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1767         * "}"
1768         * Ct ( Cc "Close" )

```

For the command `\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

1769 lpeg = lpeg +
1770   L ( P [[\alt]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
1771   * ( braces /
1772     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1773   * L ( P "}{" )
1774   * ( braces /
1775     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1776   * L ( P "}" )

```

For `\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

1777 lpeg = lpeg +
1778   L ( P [[\temporal]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
1779   * ( braces
1780     / ( function ( s )
1781       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1782   * L ( P "}{" )
1783   * ( braces
1784     / ( function ( s )
1785       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1786   * L ( P "}{" )
1787   * ( braces
1788     / ( function ( s )
1789       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1790   * L ( P "}" )

```

Now, the environments of Beamer.

```

1791 for _, x in ipairs ( piton.beamer_environments ) do
1792   lpeg = lpeg +
1793     Ct ( Cc "Open"
1794     * C (
1795       P ( [[\begin{}]] .. x .. "}" )
1796       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1797     )
1798     * Cc ( [[\end{}]] .. x .. "}" )
1799   )
1800   *
1801   ( ( 1 - P ( [[\end{}]] .. x .. "}" ) ) ^ 0 )
1802   / ( function ( s )
1803     if s ~= '' then return
1804       LPEG1[lang] : match ( s )
1805     end
1806   end )
1807   )
1808   * P ( [[\end{}]] .. x .. "}" )
1809   * Ct ( Cc "Close" )
1810 end

```

Now, you can return the value we have computed.

```

1811   return lpeg
1812 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1813 local CommentMath =
1814   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```
1815 local PromptHastyDetection =
1816   ( # ( P ">>>" + "..." ) * Lc [[ \@@_prompt: ]] ) ^ -1
```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```
1817 local Prompt = K ( 'Prompt' , ( ( P ">>>" + "..." ) * P " " ^ -1 ) ^ -1 )
```

The following LPEG EOL is for the end of lines.

```
1818 local EOL =
1819   P "\r"
1820   *
1821   (
1822     space ^ 0 * -1
1823   +
```

We recall that each line of the informatic code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁵.

```
1824   Ct (
1825     Cc "EOL"
1826     *
1827     Ct ( Lc [[ \@@_end_line: ]]
1828       * BeamerEndEnvironments
1829       *
1830     (
```

If the last line of the listing is the end of an environment of Beamer (eg. `\end{uncoverenv}`), then, we don't open a new line. A token `\@@_end_line:` will be added at the end of the environment but it will be no-op since we have defined the macro `\@@_end_line:` to be no-op (even though it is also used as a marker for the TeX delimited macro `\@@_begin_line:`).

```
1831   -1
1832   +
1833   BeamerBeginEnvironments
1834   * PromptHastyDetection
1835   * Lc [[ \@@_newline:\@@_begin_line: ]]
1836   * Prompt
1837   )
1838   )
1839   )
1840   )
1841   * ( SpaceIndentation ^ 0 * # ( 1 - S " \r" ) ) ^ -1
```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```
1842 local CommentLaTeX =
1843   P ( piton.comment_latex )
1844   * Lc [[{\PitonStyle{Comment.LaTeX}}{\ignorespaces}]]
1845   * L ( ( 1 - P "\r" ) ^ 0 )
1846   * Lc "}"
1847   * ( EOL + -1 )
```

³⁵Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

10.3.2 The language Python

We open a Lua local scope for the language Python (of course, there will be also global definitions).

```
1848 do
```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```
1849 local Operator =
1850   K ( 'Operator' ,
1851     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
1852     + S "--+/*%=<>&@|" )
1853
1854 local OperatorWord =
1855   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )
```

The keyword `in` in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word` and that’s why we write the following LPEG For.

```
1856 local For = K ( 'Keyword' , P "for" )
1857   * Space
1858   * Identifier
1859   * Space
1860   * K ( 'Keyword' , P "in" )
1861
1862 local Keyword =
1863   K ( 'Keyword' ,
1864     P "as" + "assert" + "break" + "case" + "class" + "continue" + "def" +
1865     "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
1866     "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
1867     "try" + "while" + "with" + "yield" + "yield from" )
1868   + K ( 'Keyword.Constant' , P "True" + "False" + "None" )
1869
1870 local Builtin =
1871   K ( 'Name.Builtin' ,
1872     P "__import__" + "abs" + "all" + "any" + "bin" + "bool" + "bytearray" +
1873     "bytes" + "chr" + "classmethod" + "compile" + "complex" + "delattr" +
1874     "dict" + "dir" + "divmod" + "enumerate" + "eval" + "filter" + "float" +
1875     "format" + "frozenset" + "getattr" + "globals" + "hasattr" + "hash" +
1876     "hex" + "id" + "input" + "int" + "isinstance" + "issubclass" + "iter" +
1877     "len" + "list" + "locals" + "map" + "max" + "memoryview" + "min" + "next" +
1878     + "object" + "oct" + "open" + "ord" + "pow" + "print" + "property" +
1879     "range" + "repr" + "reversed" + "round" + "set" + "setattr" + "slice" +
1880     "sorted" + "staticmethod" + "str" + "sum" + "super" + "tuple" + "type" +
1881     "vars" + "zip" )
1882
1883 local Exception =
1884   K ( 'Exception' ,
1885     P "ArithmsetError" + "AssertionError" + "AttributeError" +
1886     "BaseException" + "BufferError" + "BytesWarning" + "DeprecationWarning" +
1887     "EOFError" + "EnvironmentError" + "Exception" + "FloatingPointError" +
1888     "FutureWarning" + "GeneratorExit" + "IOError" + "ImportError" +
1889     "ImportWarning" + "IndentationError" + "IndexError" + "KeyError" +
1890     "KeyboardInterrupt" + "LookupError" + "MemoryError" + "NameError" +
1891     "NotImplementedError" + "OSError" + "OverflowError" +
1892     "PendingDeprecationWarning" + "ReferenceError" + "ResourceWarning" +
1893     "RuntimeError" + "RuntimeWarning" + "StopIteration" + "SyntaxError" +
1894     "SyntaxWarning" + "SystemError" + "SystemExit" + "TabError" + "TypeError" +
1895     + "UnboundLocalError" + "UnicodeDecodeError" + "UnicodeEncodeError" +
1896     "UnicodeError" + "UnicodeTranslateError" + "UnicodeWarning" +
1897     "UserWarning" + "ValueError" + "VMSError" + "Warning" + "WindowsError" +
1898     "ZeroDivisionError" + "BlockingIOError" + "ChildProcessError" +
1899     "ConnectionError" + "BrokenPipeError" + "ConnectionAbortedError" +
1900     "ConnectionRefusedError" + "ConnectionResetError" + "FileExistsError" +
1901     "FileNotFoundException" + "InterruptedError" + "IsADirectoryError" +
```

```

1902     "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1903     "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
1904     "RecursionError" )
1905
1906 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("

```

In Python, a “decorator” is a statement whose begins by `@` which patches the function defined in the following statement.

```
1907 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG `DefClass` will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

1908 local DefClass =
1909     K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

1910 local ImportAs =
1911     K ( 'Keyword' , "import" )
1912     * Space
1913     * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1914     *
1915         ( Space * K ( 'Keyword' , "as" ) * Space
1916             * K ( 'Name.Namespace' , identifier ) )
1917         +
1918         ( SkipSpace * Q "," * SkipSpace
1919             * K ( 'Name.Namespace' , identifier ) ) ^ 0
1920     )

```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1921 local FromImport =
1922     K ( 'Keyword' , "from" )
1923     * Space * K ( 'Name.Namespace' , identifier )
1924     * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁶ in that interpolation:

```
f'Total price: {total:+.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
1925 local PercentInterpol =
1926   K ( 'String.Interpol' ,
1927     P "%"
1928     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1929     * ( S "-#0 +" ) ^ 0
1930     * ( digit ^ 1 + "*" ) ^ -1
1931     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1932     * ( S "HLL" ) ^ -1
1933     * S "sdfFeExXorgiGauc%" )
1934   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.³⁷

```
1935 local SingleShortString =
1936   WithStyle ( 'String.Short' ,
1937     Q ( P "f'" + "F'" )
1938     * (
1939       K ( 'String.Interpol' , "{}" )
1940       * K ( 'Interpol.Inside' , ( 1 - S "}!:" ) ^ 0 )
1941       * Q ( P ":" * ( 1 - S "}!:" ) ^ 0 ) ^ -1
1942       * K ( 'String.Interpol' , "}" )
1943       +
1944       SpaceInString
1945       +
1946       Q ( ( P "\\"' + "\\\\" + "{{" + "}}}" + 1 - S " {" ) ^ 1 )
1947     ) ^ 0
1948     * Q "''"
1949   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1950 Q ( P "''" + "r'" + "R'" )
1951   * ( Q ( ( P "\\"' + "\\\\" + 1 - S " '\r%" ) ^ 1 )
1952     + SpaceInString
1953     + PercentInterpol
1954     + Q "%"
1955   ) ^ 0
1956   * Q "''" )
```

³⁶There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

³⁷The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

```

1957 local DoubleShortString =
1958   WithStyle ( 'String.Short' ,
1959     Q ( P "f\" + "F\" )
1960     *
1961     K ( 'String.Interpol' , "{}" )
1962     * K ( 'Interpol.Inside' , ( 1 - S "}\":;" ) ^ 0 )
1963     * ( K ( 'String.Interpol' , ":" ) * Q ( (1 - S "}:\") ^ 0 ) ) ^ -1
1964     * K ( 'String.Interpol' , "}" )
1965   +
1966   SpaceInString
1967   +
1968   Q ( ( P "\\\\" + "\\\\" + "{{" + "}}}" + 1 - S " {}\" ) ^ 1 )
1969   ) ^ 0
1970   * Q "\\" +
1971   +
1972   Q ( P "\\" + "r\" + "R\" )
1973   * ( Q ( ( P "\\\\" + "\\\\" + 1 - S " \"\r%" ) ^ 1 )
1974     + SpaceInString
1975     + PercentInterpol
1976     + Q "%"
1977   ) ^ 0
1978   * Q "\\" )
1979
1980 local ShortString = SingleShortString + DoubleShortString

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

1981 local braces =
1982   Compute_braces
1983   (
1984     ( P "\\" + "r\" + "R\" + "f\" + "F\" )
1985     * ( P "\\\\" + 1 - S " \\" ) ^ 0 * "\\" +
1986   +
1987     ( P '\' + 'r\' + 'R\' + 'f\' + 'F\' )
1988     * ( P '\\\\' + 1 - S ' \' ) ^ 0 * '\'
1989   )
1990 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

Detected commands

```
1991 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
```

LPEG_cleaner

```
1992 LPEG_cleaner.python = Compute_LPEG_cleaner ( 'python' , braces )
```

The long strings

```

1993 local SingleLongString =
1994   WithStyle ( 'String.Long' ,
1995     ( Q ( S "ff" * P "::::" )
1996       *
1997       K ( 'String.Interpol' , "{}" )
1998       * K ( 'Interpol.Inside' , ( 1 - S "}\:\r" - "::::" ) ^ 0 )
1999       * Q ( P ":" * (1 - S "}:\r" - "::::" ) ^ 0 ) ^ -1
2000       * K ( 'String.Interpol' , "}" )
2001     +
2002     Q ( ( 1 - P "::::" - S " { }\r" ) ^ 1 )

```

```

2003      +
2004      EOL
2005      ) ^ 0
2006      +
2007      Q ( ( S "rR" ) ^ -1 * "****"
2008      *
2009      Q ( ( 1 - P "****" - S "%r" ) ^ 1 )
2010      +
2011      PercentInterpol
2012      +
2013      P "%"
2014      +
2015      EOL
2016      ) ^ 0
2017      )
2018      * Q "****" )

2019 local DoubleLongString =
2020   WithStyle ( 'String.Long' ,
2021   (
2022     Q ( S "fF" * "\\"\\\"")
2023     *
2024     Q ( 'String.Interpol', "{}" )
2025     * K ( 'Interpol.Inside' , ( 1 - S "}:r" - "\\"\\\"") ^ 0 )
2026     * Q ( ":" * (1 - S "}:r" - "\\"\\\"") ^ 0 ) ^ -1
2027     * K ( 'String.Interpol' , "}" )
2028     +
2029     Q ( ( 1 - S "{}\\r" - "\\"\\\"") ^ 1 )
2030     +
2031     EOL
2032     ) ^ 0
2033   +
2034   Q ( S "rR" ^ -1 * "\\"\\\"")
2035   *
2036   Q ( ( 1 - P "\\"\\\"" - S "%r" ) ^ 1 )
2037   +
2038   PercentInterpol
2039   +
2040   P "%"
2041   +
2042   EOL
2043   ) ^ 0
2044   )
2045   * Q "\\"\\\""
2046   )
2047 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG DefFunction which deals with the whole preamble of a function definition (which begins with `def`).

```

2048 local StringDoc =
2049   K ( 'String.Doc' , P "r" ^ -1 * "\\"\\\"")
2050   * ( K ( 'String.Doc' , (1 - P "\\"\\\"" - "\r" ) ^ 0 ) * EOL
2051     * Tab ^ 0
2052     ) ^ 0
2053   * K ( 'String.Doc' , ( 1 - P "\\"\\\"" - "\r" ) ^ 0 * "\\"\\\"")

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

2054 local Comment =
2055   WithStyle
2056   ( 'Comment' ,

```

```

2057     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
2058   )
2059   * ( EOL + -1 )

```

DefFunction The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2060 local expression =
2061   P { "E" ,
2062     E = ( "" * ( P "\\" + 1 - S "'\r" ) ^ 0 * """
2063       + "" * ( P "\\" + 1 - S "\"\r" ) ^ 0 * """
2064       + "{" * V "F" * "}"
2065       + "(" * V "F" * ")"
2066       + "[" * V "F" * "]"
2067       + ( 1 - S "{}()[]\r," ) ^ 0 ,
2068     F = ( "{" * V "F" * "}"
2069       + "(" * V "F" * ")"
2070       + "[" * V "F" * "]"
2071       + ( 1 - S "{}()[]\r\"") ) ^ 0
2072   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG **Params** will be used to catch the chunk `a,b,x=10,n:int`.

```

2073 local Params =
2074   P { "E" ,
2075     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2076     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2077       *
2078         K ( 'InitialValues' , "=" * expression )
2079         + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2080       ) ^ -1
2081   }

```

The following LPEG **DefFunction** catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as **Comment**, **CommentLaTeX**, **Params**, **StringDoc**...

```

2082 local DefFunction =
2083   K ( 'Keyword' , "def" )
2084   * Space
2085   * K ( 'Name.Function.Internal' , identifier )
2086   * SkipSpace
2087   * Q "(" * Params * Q ")"
2088   * SkipSpace
2089   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1
2090   * ( C ( ( 1 - S ":\r" ) ^ 0 ) / ParseAgain )
2091   * Q ":"*
2092   * ( SkipSpace
2093     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2094     * Tab ^ 0
2095     * SkipSpace
2096     * StringDoc ^ 0 -- there may be additional docstrings
2097   ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` must appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```
2098 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL
```

The main LPEG for the language Python

```
2099 local EndKeyword
2100   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2101     EscapeMath + -1
```

First, the main loop :

```
2102 local Main =
2103   space ^ 0 * EOL -- faut-il le mettre en commentaire ?
2104   + Space
2105   + Tab

```

Here, we must not put `local`, of course.

```
2129 LPEG1.python = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³⁸.

```
2130 LPEG2.python =
2131   Ct (
2132     ( space ^ 0 * "\r" ) ^ -1
2133     * BeamerBeginEnvironments
2134     * PromptHastyDetection
2135     * Lc [[ \@@_begin_line: ]]
2136     * Prompt
2137     * SpaceIndentation ^ 0
2138     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
```

³⁸Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2139      * -1
2140      * Lc [[ \@@_end_line: ]]
2141    )

```

End of the Lua scope for the language Python.

```
2142 end
```

10.3.3 The language Ocaml

We open a Lua local scope for the language OCaml (of course, there will be also global definitions).

```

2143 do

2144   local SkipSpace = ( Q " " + EOL ) ^ 0
2145   local Space = ( Q " " + EOL ) ^ 1

2146   local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )

2147   if piton.beamer then
2148     Beamer = Compute_Beamer ( 'ocaml' , braces )
2149   end
2150   DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )
2151   local Q
2152   function Q ( pattern ) return
2153     Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2154     + Beamer + DetectedCommands + EscapeMath + Escape
2155   end

2156   local K
2157   function K ( style , pattern ) return
2158     Lc ( [[ {\PitonStyle[ ]} .. style .. "}"{"] )
2159     * Q ( pattern )
2160     * Lc "}"{"]
2161   end

2162   local WithStyle
2163   function WithStyle ( style , pattern ) return
2164     Ct ( Cc "Open" * Cc ( [[{\PitonStyle[ ]} .. style .. "}"{"] ) * Cc "}"{"]
2165     * ( pattern + Beamer + DetectedCommands + EscapeMath + Escape )
2166     * Ct ( Cc "Close" )
2167   end

```

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write $(1 - S "()")$ with outer parenthesis.

```

2168   local balanced_parens =
2169     P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "()" ) ) ^ 0 }

```

The strings of OCaml

```

2170 local ocaml_string =
2171   Q "\""
2172   *
2173     SpaceInString
2174     +
2175     Q ( ( 1 - S " \r" ) ^ 1 )
2176     +
2177     EOL
2178   ) ^ 0
2179   * Q "\""
2180
2181 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string

and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua’s long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2181 local ext = ( R "az" + "_" ) ^ 0
2182 local open = "{" * Cg ( ext , 'init' ) * "|"
2183 local close = "|" * C ( ext ) * "}"
2184 local closeeq =
2185   Cmt ( close * Cb ( 'init' ) ,
2186         function ( s , i , a , b ) return a == b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

2187 local QuotedStringBis =
2188   WithStyle ( 'String.Long' ,
2189   (
2190     Space
2191     +
2192     Q ( ( 1 - S " \r" ) ^ 1 )
2193     +
2194     EOL
2195   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2196 local QuotedString =
2197   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2198   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

In OCaml, the delimiters for the comments are `(* and *)`. There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2199 local Comment =
2200   WithStyle ( 'Comment' ,
2201   P {
2202     "A" ,
2203     A = Q "(*"
2204     * ( V "A"
2205       + Q ( ( 1 - S "\r$\" - "(*" - "*") ) ^ 1 ) -- $
2206       + ocaml_string
2207       + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2208       + EOL
2209     ) ^ 0
2210     * Q "*)"
2211   } )

```

Some standard LPEG

```
2212 local Delim = Q ( P "[" + "]" + S "[()]" )
2213 local Punct = Q ( S ",;:;" )
```

The identifiers caught by `cap_identifier` begin with a capital. In OCaml, it's used for the constructors of types and for the names of the modules.

```
2214 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0

2215 local Constructor =
2216   K ( 'Name.Constructor' ,
2217     Q "`" ^ -1 * cap_identifier
```

We consider `::` and `[]` as constructors (of the lists) as does the Tuareg mode of Emacs.

```
2218   + Q "::"
2219   + Q "[" * SkipSpace * Q "]")
```

```
2220 local ModuleType = K ( 'Name.Type' , cap_identifier )
```

```
2221 local OperatorWord =
2222   K ( 'Operator.Word' ,
2223     P "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
```

In OCaml, some keywords are considered as *governing keywords* with some special syntactic characteristics.

```
2224 local governing_keyword = P "and" + "begin" + "class" + "constraint" +
2225   "end" + "external" + "functor" + "include" + "inherit" + "initializer" +
2226   "in" + "let" + "method" + "module" + "object" + "open" + "rec" + "sig" +
2227   "struct" + "type" + "val"

2228 local Keyword =
2229   K ( 'Keyword' ,
2230     P "assert" + "as" + "done" + "downto" + "do" + "else" + "exception"
2231     + "for" + "function" + "fun" + "if" + "lazy" + "match" + "mutable"
2232     + "new" + "of" + "private" + "raise" + "then" + "to" + "try"
2233     + "virtual" + "when" + "while" + "with" )
2234   + K ( 'Keyword.Constant' , P "true" + "false" )
2235   + K ( 'Keyword.Governing' , governing_keyword )

2236 local EndKeyword
2237   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape
2238   + EscapeMath + -1
```

Now, the identifier. Recall that we have also a LPEG `cap_identifier` for the identifiers beginning with a capital letter.

```
2239 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2240   - ( OperatorWord + Keyword ) * EndKeyword
```

We have the internal style `Identifier.Internal` in order to be able to implement the mechanism `\SetPitonIdentifier`. The final user has access to a style called `Identifier`.

```
2241 local Identifier = K ( 'Identifier.Internal' , identifier )
```

In OCmal, *character* is a type different of the type **string**.

```

2242 local Char =
2243   K ( 'String.Short' ,
2244     P """ *
2245     (
2246       ( 1 - S "'\\\" )
2247       + "\\\"
2248       * ( S "\\\'ntbr """
2249         + digit * digit * digit
2250         + P "x" * ( digit + R "af" + R "AF" )
2251           * ( digit + R "af" + R "AF" )
2252             * ( digit + R "af" + R "AF" )
2253               + P "o" * R "03" * R "07" * R "07" )
2254     )
2255   * """ )

```

For the parameter of the types (for example : `\\a as in `a list).

```

2256 local TypeParameter =
2257   K ( 'TypeParameter' ,
2258     """ * Q"_-" ^ -1 * alpha ^ 1 * ( # ( 1 - P """ ) + -1 ) )

```

The records

```

2259 local expression_for_fields_type =
2260   P { "E" ,
2261     E = (   "{" * V "F" * "}"
2262       + "(" * V "F" * ")"
2263       + TypeParameter
2264       + ( 1 - S "{}()[]\r;" ) ^ 0 ,
2265     F = (   "{" * V "F" * "}"
2266       + "(" * V "F" * ")"
2267       + ( 1 - S "{}()[]\r\""" ) + TypeParameter ) ^ 0
2268   }
2269
2270 local expression_for_fields_value =
2271   P { "E" ,
2272     E = (   "{" * V "F" * "}"
2273       + "(" * V "F" * ")"
2274       + "[" * V "F" * "]"
2275       + String + QuotedString + Char
2276       + ( 1 - S "{}()[]\r;" ) ^ 0 ,
2277     F = (   "{" * V "F" * "}"
2278       + "(" * V "F" * ")"
2279       + "[" * V "F" * "]"
2280       + ( 1 - S "{}()[]\r\""" ) ^ 0
2281   }
2282
2283 local OneFieldDefinition =
2284   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2285   * K ( 'Name.Field' , identifier ) * SkipSpace
2286   * Q ":" * SkipSpace
2287   * K ( 'TypeExpression' , expression_for_fields_type )
2288   * SkipSpace
2289
2290 local OneField =
2291   K ( 'Name.Field' , identifier ) * SkipSpace
2292   * Q "=" * SkipSpace
2293   * ( expression_for_fields_value / ParseAgain )
2294   * SkipSpace

```

The *records* may occur in the definitions of type (beginning by `type`) but also when used as values.

```

2292 local Record =
2293   Q "{" * SkipSpace
2294   *
2295   (
2296     OneFieldDefinition
2297     * ( Q ";" * SkipSpace * ( Comment * SkipSpace ) ^ 0 * OneFieldDefinition ) ^ 0
2298     +
2299     OneField * ( Q ";" * SkipSpace * ( Comment * SkipSpace ) ^ 0 * OneField ) ^ 0
2300   )
2301   * SkipSpace

2487       "union" + "using" + "virtual" + "volatile" + "while"
2488     )
2489     + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
2490
2491   local Builtin =
2492     K ( 'Name.Builtin' ,
2493       P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
2494
2495   local Type =
2496     K ( 'Name.Type' ,

```

```

2497     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2498     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2499     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2500
2501 local DefFunction =
2502   Type
2503   * Space
2504   * Q "*" ^ -1
2505   * K ( 'Name.Function.Internal' , identifier )
2506   * SkipSpace
2507   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

2508 local DefClass =
2509   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```

2510 String =
2511   WithStyle ( 'String.Long' ,
2512     Q "\""
2513     * ( SpaceInString
2514       + K ( 'String.Interpol' ,
2515         "%" * ( S "difcspxYou" + "ld" + "li" + "hd" + "hi" )
2516         )
2517       + Q ( ( P "\\\\" + 1 - S " \""
2518         ) ^ 1
2519       * Q "\""
2520     )

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2521 local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2522 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2523 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2524 LPEG_cleaner.c = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```

2525 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

2526 local Comment =
2527   WithStyle ( 'Comment' ,
2528     Q "//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2529     * ( EOL + -1 )
2530
2531 local LongComment =
2532   WithStyle ( 'Comment' ,
2533     Q "/*"
2534     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2535     * Q "*/"
2536   ) -- $

```

The main LPEG for the language C

```

2537 local EndKeyword
2538   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2539   EscapeMath + -1

```

First, the main loop :

```

2540 local Main =
2541   space ^ 0 * EOL
2542   + Space
2543   + Tab
2544   + Escape + EscapeMath
2545   + CommentLaTeX
2546   + Beamer
2547   + DetectedCommands
2548   + Preproc
2549   + Comment + LongComment
2550   + Delim
2551   + Operator
2552   + String
2553   + Punct
2554   + DefFunction
2555   + DefClass
2556   + Type * ( Q "*" ^ -1 + EndKeyword )
2557   + Keyword * EndKeyword
2558   + Builtin * EndKeyword
2559   + Identifier
2560   + Number
2561   + Word

```

Here, we must not put `local`, of course.

```
2562 LPEG1.c = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³⁹.

```

2563 LPEG2.c =
2564 Ct (
2565   ( space ^ 0 * P "\r" ) ^ -1
2566   * BeamerBeginEnvironments
2567   * Lc [[ \@@_begin_line: ]]
2568   * SpaceIndentation ^ 0
2569   * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2570   * -1
2571   * Lc [[ \@@_end_line: ]]
2572 )

```

³⁹Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

End of the Lua scope for the language C.

```
2573 end
```

10.3.5 The language SQL

We open a Lua local scope for the language SQL (of course, there will be also global definitions).

```
2574 do
```

```
2575     local LuaKeyword
2576     function LuaKeyword ( name ) return
2577         Lc [[ {\PitonStyle{Keyword}}{ } ]]
2578         * Q ( Cmt (
2579             C ( letter * alphanum ^ 0 ) ,
2580             function ( s , i , a ) return string.upper ( a ) == name end
2581         )
2582     )
2583     * Lc "}"}
2584 end
```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```
2585     local identifier =
2586         letter * ( alphanum + "-" ) ^ 0
2587         + P '!' * ( ( 1 - P '!' ) ^ 1 ) * '!'
2588     local Operator =
2589         K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )
```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

The following function converts a comma-separated list in a "set", that is to say a Lua table with a fast way to test whether a string belongs to that set (eventually, the indexation of the components of the table is no longer done by integers but by the strings themselves).

```
2590     local Set
2591     function Set ( list )
2592         local set = { }
2593         for _ , l in ipairs ( list ) do set[l] = true end
2594         return set
2595     end
```

We now use the previous function Set to create the "sets" `set_keywords` and `set_builtin`.

```
2596     local set_keywords = Set
2597     {
2598         "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2599         "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2600         "DROP" , "EXCEPT" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" ,
2601         "INSERT" , "INTERSECT" , "INTO" , "IS" , "JOIN" , "LEFT" , "LIKE" , "LIMIT" ,
2602         "MERGE" , "NOT" , "NULL" , "OFFSET" , "ON" , "OR" , "ORDER" , "OVER" ,
2603         "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" , "UNION" ,
2604         "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2605     }
2606     local set_builtins = Set
2607     {
2608         "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2609         "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2610         "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2611     }
```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2612 local Identifier =
2613   C ( identifier ) /
2614   (
2615     function ( s )
2616       if set_keywords[string.upper(s)] then return
2617         { {[{\PitonStyle{Keyword}[]}]} , ,
2618         { luatexbase.catcodetables.other , s } ,
2619         { "}}" }
2620       else
2621         if set_builtins[string.upper(s)] then return
2622           { {[{\PitonStyle{Name.Builtin}[]}]} , ,
2623           { luatexbase.catcodetables.other , s } ,
2624           { "}}" }
2625       else return
2626         { {[{\PitonStyle{Name.Field}[]}]} , ,
2627         { luatexbase.catcodetables.other , s } ,
2628         { "}}" }
2629       end
2630     end
2631   end
2632 )

```

The strings of SQL

```

2633 local String = K ( 'String.Long' , "" * ( 1 - P "" ) ^ 1 * "" )

```

Beamer The argument of Compute_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

2634 local braces = Compute_braces ( "" * ( 1 - P "" ) ^ 1 * "" )
2635 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2636 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2637 LPEG_cleaner.sql = Compute_LPEG_cleaner ( 'sql' , braces )

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

2638 local Comment =
2639   WithStyle ( 'Comment' ,
2640     Q "--" -- syntax of SQL92
2641     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2642     * ( EOL + -1 )
2643
2644 local LongComment =
2645   WithStyle ( 'Comment' ,
2646     Q "/*"
2647     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2648     * Q "*/"
2649   ) -- $

```

The main LPEG for the language SQL

```

2650 local EndKeyword
2651   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2652     EscapeMath + -1
2653

2781     )

```

End of the Lua scope for the language “Minimal”.

```
2782 end
```

10.3.7 The language “Verbatim”

We open a Lua local scope for the language “Verbatim” (of course, there will be also global definitions).

```
2783 do
```

Here, we don’t use braces as done with the other languages because we don’t have to take into account the strings (there is no string in the language “Verbatim”).

```

2784 local braces =
2785     P { "E" ,
2786         E = ( "{" * V "E" * "}" + ( 1 - S "{}" ) ) ^ 0
2787     }
2788
2789 if piton.beamer then Beamer = Compute_Beamer ( 'verbatim' , braces ) end
2790
2791 DetectedCommands = Compute_DetectedCommands ( 'verbatim' , braces )
2792
2793 LPEG_cleaner.verbatim = Compute_LPEG_cleaner ( 'verbatim' , braces )

```

Now, you will construct the LPEG Word.

```

2794 local lpeg_central = 1 - S " \\r"
2795 if piton.begin_escape then
2796     lpeg_central = lpeg_central - piton.begin_escape
2797 end
2798 if piton.begin_escape_math then
2799     lpeg_central = lpeg_central - piton.begin_escape_math
2800 end

```

```

2801 local Word = Q ( lpeg_central ^ 1 )
2802
2803 local Main =
2804     space ^ 0 * EOL
2805     + Space
2806     + Tab
2807     + Escape + EscapeMath
2808     + Beamer
2809     + DetectedCommands
2810     + Q [[ ]]
2811     + Word

```

Here, we must not put `local`, of course.

```

2812 LPEG1.verbatim = Main ^ 0
2813
2814 LPEG2.verbatim =
2815 Ct (
2816     ( space ^ 0 * "\r" ) ^ -1
2817     * BeamerBeginEnvironments
2818     * Lc [[ \@@_begin_line: ]]
2819     * SpaceIndentation ^ 0
2820     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2821     * -1
2822     * Lc [[ \@@_end_line: ]]
2823 )

```

End of the Lua scope for the language “`verbatim`”.

```
2824 end
```

10.3.8 The function Parse

The function `Parse` is the main function of the package `piton`. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`LPEG2[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```
2825 function piton.Parse ( language , code )
```

The variable `piton.language` will be used by the function `ParseAgain`.

```

2826 piton.language = language
2827 local t = LPEG2[language] : match ( code )
2828 if t == nil then
2829     sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
2830     return -- to exit in force the function
2831 end
2832 local left_stack = {}
2833 local right_stack = {}
2834 for _ , one_item in ipairs ( t ) do
2835     if one_item[1] == "EOL" then
2836         for _ , s in ipairs ( right_stack ) do
2837             tex.sprint ( s )
2838         end
2839         for _ , s in ipairs ( one_item[2] ) do
2840             tex.tprint ( s )
2841         end
2842         for _ , s in ipairs ( left_stack ) do
2843             tex.sprint ( s )
2844         end
2845     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}{2}" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`{uncover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}{2}` and `right_stack` will be for the elements like `\end{uncover}`.

```
2846     if one_item[1] == "Open" then
2847         tex.sprint( one_item[2] )
2848         table.insert ( left_stack , one_item[2] )
2849         table.insert ( right_stack , one_item[3] )
2850     else
2851         if one_item[1] == "Close" then
2852             tex.sprint ( right_stack[#right_stack] )
2853             left_stack[#left_stack] = nil
2854             right_stack[#right_stack] = nil
2855         else
2856             tex.tprint ( one_item )
2857         end
2858     end
2859   end
2860 end
2861 end
```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```
2862 function piton.ParseFile
2863   ( lang , name , first_line , last_line , splittable , split )
2864   local s = ''
2865   local i = 0
```

At the date of septembre 2024, LuaLaTeX uses Lua 5.3 and not 5.4. In the version 5.4, `io.lines` returns four values (and not just one) but the following code should be correct.

```
2866   for line in io.lines ( name ) do
2867     i = i + 1
2868     if i >= first_line then
2869       s = s .. '\r' .. line
2870     end
2871     if i >= last_line then break end
2872   end
```

We extract the BOM of utf-8, if present.

```
2873   if string.byte ( s , 1 ) == 13 then
2874     if string.byte ( s , 2 ) == 239 then
2875       if string.byte ( s , 3 ) == 187 then
2876         if string.byte ( s , 4 ) == 191 then
2877           s = string.sub ( s , 5 , -1 )
2878         end
2879       end
2880     end
2881   end
2882   if split == 1 then
2883     piton.RetrieveGobbleSplitParse ( lang , 0 , splittable , s )
2884   else
2885     piton.RetrieveGobbleParse ( lang , 0 , splittable , s )
2886   end
2887 end

2888 function piton.RetrieveGobbleParse ( lang , n , splittable , code )
2889   local s
2890   s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
2891   piton.GobbleParse ( lang , n , splittable , s )
2892 end
```

10.3.9 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```
2893 function piton.ParseBis ( lang , code )
2894   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2895   return piton.Parse ( lang , s )
2896 end
```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2897 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space::`

```
2898 local s
2899 s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2900 : match ( code )
```

Remember that `\@@_leading_space:` does not create a space, only an incrementation of the counter `\g_@@_indentation_int`. That's why we don't replace it by a space...

```
2901 s = ( Cs ( ( P [[\@@_leading_space: ]] / ' ' + 1 ) ^ 0 ) )
2902 : match ( s )
2903 return piton.Parse ( lang , s )
2904 end
```

10.3.10 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```
2905 local AutoGobbleLPEG =
2906   (
2907     P " " ^ 0 * "\r"
2908     +
2909     Ct ( C " " ^ 0 ) / table.getn
2910     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2911   ) ^ 0
2912   * ( Ct ( C " " ^ 0 ) / table.getn
2913     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2914 ) / math.min
```

The following LPEG is similar but works with the tabulations.

```
2915 local TabsAutoGobbleLPEG =
2916   (
2917     (
2918       P "\t" ^ 0 * "\r"
2919       +
2920       Ct ( C "\t" ^ 0 ) / table.getn
2921       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2922     ) ^ 0
2923     * ( Ct ( C "\t" ^ 0 ) / table.getn
2924       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2925   ) / math.min
```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2926 local EnvGobbleLPEG =
2927   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2928   * Ct ( C " " ^ 0 * -1 ) / table.getn
2929
2930 local remove_before_cr
2931 function remove_before_cr ( input_string )
2932   local match_result = ( P "\r" ) : match ( input_string )
2933   if match_result then return
2934     string.sub ( input_string , match_result )
2935   else return
2936     input_string
2937   end
2938 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

2938 local gobble
2939 function gobble ( n , code )
2940   code = remove_before_cr ( code )
2941   if n == 0 then return
2942     code
2943   else
2944     if n == -1 then
2945       n = AutoGobbleLPEG : match ( code )
2946     else
2947       if n == -2 then
2948         n = EnvGobbleLPEG : match ( code )
2949       else
2950         if n == -3 then
2951           n = TabsAutoGobbleLPEG : match ( code )
2952         end
2953       end
2954     end
2955   end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2955   if n == 0 then return
2956     code
2957   else return

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of n .

```

2958   ( Ct (
2959     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2960     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2961       ) ^ 0 )
2962     / table.concat
2963   ) : match ( code )
2964 end
2965 end
2966 end

```

In the following code, n is the value of `\l_@@_gobble_int`.
`splittable` is the value of `\l_@@_splittable_int`.

```

2967 function piton.GobbleParse ( lang , n , splittable , code )
2968   piton.ComputeLinesStatus ( code , splittable )
2969   piton.last_code = gobble ( n , code )
2970   piton.last_language = lang

```

We count the number of lines of the informatic code. The result will be stored by Lua in `\l_@@_nb_lines_int`.

```

2971 piton.CountLines ( piton.last_code )
2972 sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes ]]
2973 piton.Parse ( lang , piton.last_code )
2974 sprintL3 [[ \vspace{2.5pt} ]]
2975 sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \endsavenotes ]]

```

We finish the paragraph (each line of the listing is composed in a TeX box — with potentially several lines when `break-lines-in-Piton` is in force — put alone in a paragraph).

```
2976 sprintL3 [[ \par ]]
```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```

2977 if piton.write and piton.write ~= '' then
2978   local file = io.open ( piton.write , piton.write_mode )
2979   if file then
2980     file : write ( piton.get_last_code ( ) )
2981     file : close ( )
2982   else
2983     sprintL3 [[ \@@_error_or_warning:n { FileError } ]]
2984   end
2985 end
2986 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```

2987 function piton.GobbleSplitParse ( lang , n , splittable , code )
2988   local chunks
2989   chunks =
2990   (
2991     Ct (
2992       (
2993         P " " ^ 0 * "\r"
2994         +
2995         C ( ( ( 1 - P "\r" ) ^ 1 * "\r" - ( P " " ^ 0 * "\r" ) ) ^ 1 )
2996         ) ^ 0
2997       )
2998     ) : match ( gobble ( n , code ) )
2999   sprintL3 [[ \begingroup ]]
3000   sprintL3
3001   (
3002     [[ \PitonOptions { split-on-empty-lines = false, gobble = 0, }]
3003     .. "language = " .. lang .. ","
3004     .. "splittable = " .. splittable .. "}"
3005   )
3006   for k , v in pairs ( chunks ) do
3007     if k > 1 then
3008       sprintL3 [[ \l_@@_split_separation_tl ]]
3009     end
3010     tex.sprint
3011     (
3012       [[\begin{}]] .. piton.env_used_by_split .. "}\r"
3013       .. v
3014       .. [[\end{}]] .. piton.env_used_by_split .. "}"
3015     )
3016   end
3017   sprintL3 [[ \endgroup ]]
3018 end

```

```

3019 function piton.RetrieveGobbleSplitParse ( lang , n , splittable , code )
3020   local s
3021   s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3022   piton.GobbleSplitParse ( lang , n , splittable , s )
3023 end

```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibility. The token list `\l_@@_split_separation_t1` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

3024 piton.string_between_chunks =
3025 [[ \par \l_@@_split_separation_t1 \mode_leave_vertical: ]]
3026 .. [[ \int_gzero:N \g_@@_line_int ]]

```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

3027 function piton.get_last_code ( )
3028   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
3029 end

```

10.3.11 To count the number of lines

```

3030 function piton.CountLines ( code )
3031   local count = 0
3032   count =
3033     ( Ct ( ( ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3034       * ( ( 1 - P "\r" ) ^ 1 * Cc "\r" ) ^ -1
3035       * -1
3036     ) / table.getn
3037   ) : match ( code )
3038   sprintL3 ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
3039 end

```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```

3040 function piton.CountNonEmptyLines ( code )
3041   local count = 0
3042   count =
3043     ( Ct ( ( P " " ^ 0 * "\r"
3044       + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3045       * ( 1 - P "\r" ) ^ 0
3046       * -1
3047     ) / table.getn
3048   ) : match ( code )
3049   sprintL3
3050   ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { %i } ]], count ) )
3051 end

```

```

3052 function piton.CountLinesFile ( name )
3053   local count = 0
3054   for line in io.lines ( name ) do count = count + 1 end
3055   sprintL3
3056   ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
3057 end

```

```

3058 function piton.CountNonEmptyLinesFile ( name )

```

```

3059 local count = 0
3060 for line in io.lines ( name ) do
3061   if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
3062     count = count + 1
3063   end
3064 end
3065 sprintL3
3066   ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
3067 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

3068 function piton.ComputeRange(marker_beginning,marker_end,file_name)
3069   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
3070   local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
3071   local first_line = -1
3072   local count = 0
3073   local last_found = false
3074   for line in io.lines ( file_name ) do
3075     if first_line == -1 then
3076       if string.sub ( line , 1 , #s ) == s then
3077         first_line = count
3078       end
3079     else
3080       if string.sub ( line , 1 , #t ) == t then
3081         last_found = true
3082         break
3083       end
3084     end
3085     count = count + 1
3086   end
3087   if first_line == -1 then
3088     sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
3089   else
3090     if last_found == false then
3091       sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
3092     end
3093   end
3094   sprintL3 (
3095     [[ \int_set:Nn \l_@@_first_line_int { }] .. first_line .. ' + 2 ']
3096     .. [[ \int_set:Nn \l_@@_last_line_int { }] .. count .. ' } ]
3097 end

```

10.3.12 To determine the empty lines of the listings

Despite its name, the Lua function `ComputeLinesStatus` computes `piton.lines_status` but also `piton.empty_lines`.

In `piton.empty_lines`, a line will have the number 0 if it's a empty line (in fact a blank line, with only spaces) and 1 elsewhere.

In `piton.lines_status`, each line will have a status with regard the breaking points allowed (for the changes of pages).

- 0 if the line is empty and a page break is allowed;
- 1 if the line is not empty but a page break is allowed after that line;
- 2 if a page break is *not* allowed after that line (empty or not empty).

`splittable` is the value of `\l_@@_splittable_int`. However, if `splittable-on-empty-lines` is in force, `splittable` is the opposite of `\l_@@_splittable_int`.

```

3098 function piton.ComputeLinesStatus ( code , splittable )

```

The lines in the listings which correspond to the beginning or the end of an environment of Beamer (eg. `\begin{uncoverenv}`) must be retrieved (those lines have *no* number and therefore, *no* status).

```

3099 local lpeg_line_beamer
3100 if piton.beamer then
3101   lpeg_line_beamer =
3102     space ^ 0
3103     * P [[\begin{}]] * piton.BeamerEnvironments * "}"
3104     * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
3105   +
3106   space ^ 0
3107     * P [[\end{}]] * piton.BeamerEnvironments * "}"
3108 else
3109   lpeg_line_beamer = P ( false )
3110 end
3111
3112 local lpeg_empty_lines =
3113   Ct (
3114     ( lpeg_line_beamer * "\r"
3115       +
3116       P " " ^ 0 * "\r" * Cc ( 0 )
3117       +
3118       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3119     ) ^ 0
3120     *
3121     ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3122   )
3123   * -1
3124
3125 local lpeg_all_lines =
3126   Ct (
3127     ( lpeg_line_beamer * "\r"
3128       +
3129       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3130     ) ^ 0
3131     *
3132     ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3133   )
3134   * -1

```

We begin with the computation of `piton.empty_lines`. It will be used in conjunction with `line-numbers`.

```
3133 piton.empty_lines = lpeg_empty_lines : match ( code )
```

Now, we compute `piton.lines_status`. It will be used in conjunction with `splittable` and `splittable-on-empty-lines`.

Now, we will take into account the current value of `\l_@@_splittable_int` (provided by the *absolute value* of the argument `splittable`).

```

3134 local lines_status
3135 local s = splittable
3136 if splittable < 0 then s = - splittable end
3137 if splittable > 0 then
3138   lines_status = lpeg_all_lines : match ( code )
3139 else

```

Here, we should try to copy `piton.empty_lines` but it's not easy.

```

3140 lines_status = lpeg_empty_lines : match ( code )
3141 for i , x in ipairs ( lines_status ) do
3142   if x == 0 then
3143     for j = 1 , s - 1 do
3144       if i + j > #lines_status then break end
3145       if lines_status[i+j] == 0 then break end
3146       lines_status[i+j] = 2
3147     end
3148   for j = 1 , s - 1 do

```

```

3149     if i - j == 1 then break end
3150     if lines_status[i-j-1] == 0 then break end
3151     lines_status[i-j-1] = 2
3152   end
3153 end
3154 end
3155 end

```

In all cases (whatever is the value of `splittable-on-empty-lines`) we have to deal with both extremities of the listing to format.

First from the beginning of the code.

```

3156 for j = 1 , s - 1 do
3157   if j > #lines_status then break end
3158   if lines_status[j] == 0 then break end
3159   lines_status[j] = 2
3160 end

```

Now, from the end of the code.

```

3161 for j = 1 , s - 1 do
3162   if #lines_status - j == 0 then break end
3163   if lines_status[#lines_status - j] == 0 then break end
3164   lines_status[#lines_status - j] = 2
3165 end

3166 piton.lines_status = lines_status
3167 end

```

10.3.13 To create new languages with the syntax of listings

```

3168 function piton.new_language ( lang , definition )
3169   lang = string.lower ( lang )

3170   local alpha , digit = lpeg.alpha , lpeg.digit
3171   local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `alsoother`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

3172   function add_to_letter ( c )
3173     if c ~= " " then table.insert ( extra_letters , c ) end
3174   end

```

For the digits, it's straightforward.

```

3175   function add_to_digit ( c )
3176     if c ~= " " then digit = digit + c end
3177   end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

3178   local other = S ":_@+*/<>!?; .()~^=#!\"\\\$" -- $
3179   local extra_others = { }
3180   function add_to_other ( c )
3181     if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

3182     extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

3183     other = other + P ( c )
3184   end
3185 end

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

3186 local def_table
3187 if ( S ", " ^ 0 * -1 ) : match ( definition ) then
3188   def_table = {}
3189 else
3190   local strict_braces =
3191     P { "E" ,
3192       E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
3193       F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
3194     }
3195   local cut_definition =
3196     P { "E" ,
3197       E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
3198       F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
3199                 * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
3200     }
3201   def_table = cut_definition : match ( definition )
3202 end

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

3203 local tex_braced_arg = "{" * C ( ( 1 - P "}" ) ^ 0 ) * "}"
3204 local tex_arg = tex_braced_arg + C ( 1 )
3205 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
3206 local args_for_tag
3207   = tex_option_arg
3208   * space ^ 0
3209   * tex_arg
3210   * space ^ 0
3211   * tex_arg
3212 local args_for_morekeywords
3213   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3214   * space ^ 0
3215   * tex_option_arg
3216   * space ^ 0
3217   * tex_arg
3218   * space ^ 0
3219   * ( tex_braced_arg + Cc ( nil ) )
3220 local args_for_moredelims
3221   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
3222   * args_for_morekeywords
3223 local args_for_morecomment
3224   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3225   * space ^ 0
3226   * tex_option_arg
3227   * space ^ 0
3228   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

3229 local sensitive = true
3230 local style_tag , left_tag , right_tag
3231 for _ , x in ipairs ( def_table ) do

```

```

3232 if x[1] == "sensitive" then
3233   if x[2] == nil or ( P "true" ) : match ( x[2] ) then
3234     sensitive = true
3235   else
3236     if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
3237   end
3238 end
3239 if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
3240 if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
3241 if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
3242 if x[1] == "tag" then
3243   style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
3244   style_tag = style_tag or [[:PitonStyle{Tag}]]
3245 end
3246 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

3247 local Number =
3248   K ( 'Number' ,
3249     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
3250       + digit ^ 0 * "." * digit ^ 1
3251       + digit ^ 1 )
3252     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
3253     + digit ^ 1
3254   )
3255 local string_extra_letters = ""
3256 for _ , x in ipairs ( extra_letters ) do
3257   if not ( extra_others[x] ) then
3258     string_extra_letters = string_extra_letters .. x
3259   end
3260 end
3261 local letter = alpha + S ( string_extra_letters )
3262   + P "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "ï" + "î"
3263   + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
3264   + "î" + "î" + "ô" + "û" + "ü"
3265 local alphanum = letter + digit
3266 local identifier = letter * alphanum ^ 0
3267 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

3268 local split_clist =
3269   P { "E" ,
3270     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
3271     * ( P "{" ) ^ 1
3272     * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
3273     * ( P "}" ) ^ 1 * space ^ 0 ,
3274     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
3275   }

```

The following function will be used if the keywords are not case-sensitive.

```

3276 local keyword_to_lpeg
3277 function keyword_to_lpeg ( name ) return
3278   Q ( Cmt (
3279     C ( identifier ) ,
3280     function ( s , i , a ) return
3281       string.upper ( a ) == string.upper ( name )
3282     end
3283   )
3284 )
3285 end
3286 local Keyword = P ( false )
3287 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

3288   for _ , x in ipairs ( def_table )
3289     do if x[1] == "morekeywords"
3290       or x[1] == "otherkeywords"
3291       or x[1] == "moredirectives"
3292       or x[1] == "moretexcs"
3293     then
3294       local keywords = P ( false )
3295       local style = [ \PitonStyle{Keyword} ]
3296       if x[1] == "moredirectives" then style = [ \PitonStyle{Directive} ] end
3297       style = tex_option_arg : match ( x[2] ) or style
3298       local n = tonumber ( style )
3299       if n then
3300         if n > 1 then style = [ \PitonStyle{Keyword} ] .. style .. "}" end
3301       end
3302       for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
3303         if x[1] == "moretexcs" then
3304           keywords = Q ( [ \ ] .. word ) + keywords
3305         else
3306           if sensitive

```

The documentation of `lstdlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

3307         then keywords = Q ( word ) + keywords
3308         else keywords = keyword_to_lpeg ( word ) + keywords
3309       end
3310     end
3311   end
3312   Keyword = Keyword +
3313   Lc ( "{" .. style .. "(" ) * keywords * Lc "}"
3314 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

3315   if x[1] == "keywordsprefix" then
3316     local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3317     PrefixedKeyword = PrefixedKeyword
3318     + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
3319   end
3320 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3321   local long_string = P ( false )
3322   local Long_string = P ( false )
3323   local LongString = P ( false )
3324   local central_pattern = P ( false )
3325   for _ , x in ipairs ( def_table ) do
3326     if x[1] == "morestring" then
3327       arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3328       arg2 = arg2 or [ \PitonStyle{String.Long} ]
3329       if arg1 ~= "s" then
3330         arg4 = arg3
3331       end
3332       central_pattern = 1 - S ( " \r" .. arg4 )

```

```

3333     if arg1 : match "b" then
3334         central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3335     end

```

In fact, the specifier d is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

3336     if arg1 : match "d" or arg1 == "m" then
3337         central_pattern = P ( arg3 .. arg3 ) + central_pattern
3338     end
3339     if arg1 == "m"
3340     then prefix = B ( 1 - letter - ")" - "]" )
3341     else prefix = P ( true )
3342     end

```

First, a pattern *without captures* (needed to compute braces).

```

3343     long_string = long_string +
3344         prefix
3345         * arg3
3346         * ( space + central_pattern ) ^ 0
3347         * arg4

```

Now a pattern *with captures*.

```

3348     local pattern =
3349         prefix
3350         * Q ( arg3 )
3351         * ( SpaceInString + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3352         * Q ( arg4 )

```

We will need Long_string in the nested comments.

```

3353     Long_string = Long_string + pattern
3354     LongString = LongString +
3355         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3356         * pattern
3357         * Ct ( Cc "Close" )
3358     end
3359 end

```

The argument of Compute_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

3360     local braces = Compute_braces ( long_string )
3361     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3362
3363     DetectedCommands = Compute_DetectedCommands ( lang , braces )
3364
3365     LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

3366     local CommentDelim = P ( false )
3367
3368     for _ , x in ipairs ( def_table ) do
3369         if x[1] == "morecomment" then
3370             local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3371             arg2 = arg2 or [[\PitonStyle{Comment}]]

```

If the letter i is present in the first argument (eg: morecomment = [si]{(*){*}}}, then the corresponding comments are discarded.

```

3372     if arg1 : match "i" then arg2 = [[\PitonStyle{Discard}]] end
3373     if arg1 : match "l" then
3374         local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3375             : match ( other_args )
3376         if arg3 == [[\#]] then arg3 = "#" end -- mandatory
3377         CommentDelim = CommentDelim +
3378             Ct ( Cc "Open"
3379                 * Cc ( "{" .. arg2 .. "}" * Cc "}" )
3380                 * Q ( arg3 )

```

```

3381          * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3382          * Ct ( Cc "Close" )
3383          * ( EOL + -1 )
3384      else
3385          local arg3 , arg4 =
3386          ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3387      if arg1 : match "s" then
3388          CommentDelim = CommentDelim +
3389          Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3390          * Q ( arg3 )
3391          *
3392          CommentMath
3393          + Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
3394          + EOL
3395          ) ^ 0
3396          * Q ( arg4 )
3397          * Ct ( Cc "Close" )
3398      end
3399      if arg1 : match "n" then
3400          CommentDelim = CommentDelim +
3401          Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3402          * P { "A" ,
3403              A = Q ( arg3 )
3404              * ( V "A"
3405                  + Q ( ( 1 - P ( arg3 ) - P ( arg4 )
3406                      - S "\r\$\" ) ^ 1 ) -- $
3407                      + long_string
3408                      + $" -- $
3409                      * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) -- $
3410                      * $" -- $
3411                      + EOL
3412                      ) ^ 0
3413                      * Q ( arg4 )
3414          }
3415          * Ct ( Cc "Close" )
3416      end
3417  end
3418 end

```

For the keys `moredelim`, we have to add another argument in first position, equal to `*` or `**`.

```

3419 if x[1] == "moredelim" then
3420     local arg1 , arg2 , arg3 , arg4 , arg5
3421     = args_for_moredelims : match ( x[2] )
3422     local MyFun = Q
3423     if arg1 == "*" or arg1 == "**" then
3424         function MyFun ( x )
3425             if x ~= '' then return
3426                 LPEG1[lang] : match ( x )
3427                 end
3428             end
3429         end
3430         local left_delim
3431         if arg2 : match "i" then
3432             left_delim = P ( arg4 )
3433         else
3434             left_delim = Q ( arg4 )
3435         end
3436         if arg2 : match "l" then
3437             CommentDelim = CommentDelim +
3438             Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3439             * left_delim
3440             * ( MyFun ( ( 1 - P "\r" ) ^ 1 ) ) ^ 0
3441             * Ct ( Cc "Close" )
3442             * ( EOL + -1 )

```

```

3443     end
3444     if arg2 : match "s" then
3445         local right_delim
3446         if arg2 : match "i" then
3447             right_delim = P ( arg5 )
3448         else
3449             right_delim = Q ( arg5 )
3450         end
3451         CommentDelim = CommentDelim +
3452             Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" ) * Cc "}" ) )
3453             * left_delim
3454             * ( MyFun ( ( 1 - P ( arg5 ) - "\r" ) ^ 1 ) + EOL ) ^ 0
3455             * right_delim
3456             * Ct ( Cc "Close" )
3457     end
3458 end
3459 end
3460
3461 local Delim = Q ( S "{[()]}")
3462 local Punct = Q ( S "=,:;!\\"\\'\\\"")
3463
3464 local Main =
3465     space ^ 0 * EOL
3466     + Space
3467     + Tab
3468     + Escape + EscapeMath
3469     + CommentLaTeX
3470     + Beamer
3471     + DetectedCommands
3472     + CommentDelim

```

We must put `LongString` before `Delim` because, in PostScript, the strings are delimited by parenthesis and those parenthesis would be caught by `Delim`.

```

3472     + LongString
3473     + Delim
3474     + PrefixedKeyword
3475     + Keyword * ( -1 + # ( 1 - alphanum ) )
3476     + Punct
3477     + K ( 'Identifier.Internal' , letter * alphanum ^ 0 )
3478     + Number
3479     + Word

```

The `LPEG1` `LPEG1[lang]` is used to reformat small elements, for example the arguments of the “detected commands”.

Of course, here, we must not put `local`, of course.

```
3480 LPEG1[lang] = Main ^ 0
```

The `LPEG` `LPEG2[lang]` is used to format general chunks of code.

```

3481 LPEG2[lang] =
3482     Ct (
3483         ( space ^ 0 * P "\r" ) ^ -1
3484         * BeamerBeginEnvironments
3485         * Lc [[ \@@_begin_line: ]]
3486         * SpaceIndentation ^ 0
3487         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3488         * -1
3489         * Lc [[ \@@_end_line: ]]
3490     )

```

If the key `tag` has been used. Of course, this feature is designed for the HTML.

```

3491 if left_tag then
3492     local Tag = Ct ( Cc "Open" * Cc ( "{" .. style_tag .. "}" ) * Cc "}" )
3493         * Q ( left_tag * other ^ 0 ) -- $
3494         * ( ( 1 - P ( right_tag ) ) ^ 0 )
3495             / ( function ( x ) return LPEG0[lang] : match ( x ) end ) )

```

```

3496     * Q ( right_tag )
3497     * Ct ( Cc "Close" )
3498 MainWithoutTag
3499     = space ^ 1 * -1
3500     + space ^ 0 * EOL
3501     + Space
3502     + Tab
3503     + Escape + EscapeMath
3504     + CommentLaTeX
3505     + Beamer
3506     + DetectedCommands
3507     + CommentDelim
3508     + Delim
3509     + LongString
3510     + PrefixedKeyword
3511     + Keyword * ( -1 + # ( 1 - alphanum ) )
3512     + Punct
3513     + K ( 'Identifier.Internal' , letter * alphanum ^ 0 )
3514     + Number
3515     + Word
3516 LPEG0[lang] = MainWithoutTag ^ 0
3517 local LPEGaux = Tab + Escape + EscapeMath + CommentLaTeX
3518     + Beamer + DetectedCommands + CommentDelim + Tag
3519 MainWithTag
3520     = space ^ 1 * -1
3521     + space ^ 0 * EOL
3522     + Space
3523     + LPEGaux
3524     + Q ( ( 1 - EOL - LPEGaux ) ^ 1 )
3525 LPEG1[lang] = MainWithTag ^ 0
3526 LPEG2[lang] =
3527   Ct (
3528     ( space ^ 0 * P "\r" ) ^ -1
3529     * BeamerBeginEnvironments
3530     * Lc [[ \@@_begin_line: ]]
3531     * SpaceIndentation ^ 0
3532     * LPEG1[lang]
3533     * -1
3534     * Lc [[ \@@_end_line: ]]
3535   )
3536 end
3537 end
3538 
```

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension piton is done on the following GitHub repository:
<https://github.com/fpantigny/piton>

Changes between versions 4.0 and 4.1

New language `verbatim`.

New key `break-strings-anywhere`.

Changes between versions 3.1 and 4.0

This version introduces an incompatibility: the syntax for the relative and absolute paths in `\PitonInputFile` and the key `path` has been changed to be conform to usual conventions. An temporary key `old-PitonInputFile`, available at load-time, has been added for backward compatibility.

New keys `font-command`, `splittable-on-empty-lines` and `env-used-by-split`.

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by listings. Therefore, it's possible to say that virtually all the informatic languages are now supported by piton.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.

New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.
